REFERENCE NOTES

The four-digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Long-term means from which departures are computed are based on 10 years or more of record ending generally with data for 1950.

Long-term means for full-time stations (those shown in the Station Index as 'U. S. Weather Bureau') are based on the period 1921 - 1950, adjusted to represent observations taken at the present location.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 6:00 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

\# Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are publisehd later in Hourly Precipitation Data.

D Water equivalent of snowfall wholly or partly estimated, using ration of 1 inch water equivalent to every 10 inches of new snowfall.

G In the "Refer to Tables" column in the Station Index the letter "G" indicates Daily Soil Temperatures are published.

M One of more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Office Building, 50 Fulton Street, San Francisco 2, California.

CALIFORNIA

APRIL 1956
Volume LX No. 4

ASHEVILLE: 1956

WEATHER SUMMARY

The very dry conditions that prevailed over much of California during March were alleviated somewhat in April, especially in the central and southern portions where above average precipitation fell. A tornado-like wind struck the Chula Vista area in southern California on the 13th and a description of this storm as prepared by the State Climatologist at San Francisco will be found at the end of this summary.

Most stations had lower than usual temperatures for April showing negative anomalies ranging up to 5°. This resulted more from lower maximum temperatures due to above average cloudiness than from unusually low minimum temperatures. During the first few days of April temperatures averaged 5° to 10° lower than normal, as shown by Weather Bureau stations, following the passage of a cold front that had entered the State on March 31. It was during this period that the lowest monthly temperature, -10°, was recorded at both White Mountain 1 on the 3d and at White Mountain 2 on the 2d and 3d. Cool weather occurred again from the 10th to the 16th with temperatures as much as 17° below average. One more cool spell was noted from the 25th to the 28th showing temperatures to be 5° to 15° below average. There were two general warming trends from the 5th to the 9th and again from the 17th to 23d when temperatures were close to 10° above average. During these two periods, maximum temperatures were usually in the 80's in central and northern California and in the high 80's and low 90's in southern California where three stations in the desert regions recorded temperatures of 100° or higher. Cow Creek was the hottest spot in the State with a temperature reading of 104° recorded on the 23d. The monthly mean temperatures ranged from the low of 18.3° at White Mountain 2 to the high of 75.3° at Cow Creek.

The abundant precipitation brightened the outlook for crops and pasture lands throughout central and southern California, whereas much of northern California north of San Francisco on the coast, Red Bluff in the valley, and Blue Canyon in the interior, experienced relatively dry weather with the majority of stations reporting less than 50 percent of their long-term mean precipitation. Mt. Shasta had its second driest April in the past 16 years and the eighth driest since 1888. This was instrumental in causing numerous small brush fires in the nearby hills. The 0.31 inch measured at Eureka made it the second driest April on record, with only the 0.24-inch fall in April 1909 being less. However, the precipitation picture over the remainder of the State appeared to be somewhat brighter as the great majority of stations received over 100 percent of their usual April expectancy and many of these reported over 300 percent. Bishop and Burbank had their wettest April on record. San Diego, where little precipitation has fallen since the beginning of the season on July 1, 1955, received 35 percent of the seasonal fall during April. The greatest monthly total, 7.38 inches, fell at Crystal Lake East Pine Flat and the greatest 24-hour catch, 3.65 inches, was recorded at Juncal Dam on the 11th. In northern California thunderstorm activity was reported on the 10th, 16th, 25th, and 26th, and in southern California on the 1st and 18th. In fact, the Los Angeles area had a rather active April 1 when thunder, hail, lightning, rain, and snow all occurred during midday to interrupt an otherwise pleasant Easter Sunday. Rising daytime temperatures were melting much of the snowpack in the mountains although Twin Lakes still had 63 inches on the ground by April 30. Sandberg's monthly snowfall of 12.6 inches was 11.5 inches above the mean total for April.

The rainy periods during the month were generally beneficial to crops and pasture lands all over the State. In the San Diego area the lack of ample winter rains caused ranges to deteriorate and slowed the growth of grains. However, by month's end the grazing lands continued to improve and the additional moisture was expected to half size lemons, oranges, avocados, pears, and apples. Pear and apple trees were blooming profusely and prospects were for a bumper cro In the Los Angeles area the rains greatly aided in buildi reserve surface and subsoil moisture, and the slow rate fall was conducive to maximum penetration and minimum runof The rains were beneficial to ranges in the Santa Barba area and also to oranges, lemons, and newly planted toma seedbeds, but caused considerable damage to the strawber crop around Santa Maria. A large portion of non-irrigat crops were saved in the San Joaquin Valley, but the rai caused some damage to alfalfa that had been cut in t fields and increased the blight and aphis infestation e pecially on pears and walnuts. Grapevines were coming c nicely and walnuts were budding in Napa County, and Nav oranges were blossoming in Santa Clara County. Warm nigh near month's end in the Tehachapi area were very benefici to the pear crop, and the very heavy set of fruit was e timated to be best in 40 years. Light frost on the 2d the Los Angeles area and during the first week in April the San Joaquin Valley caused little or no damage. Win conditions in Imperial County on the 1st caused some dama to squash, tomatoes, and melons, and some of the barley fields that were being irrigated was blown down. More da age was caused by winds during the second and third we to melons; and some barley, flax, and wheat were knock down. Fortunately, the weather was generally favorable f growth and harvesting of all crops and for additional cott planting and seed germination. Higher temperatures and d creasing windiness toward the end of the month in the Pa Verde area favored cotton planting and the bulk of the cr was expected to be planted by the beginning of May. T reported average condition of cattle and calves at 83 pe cent of normal compares with 78 percent last year and t ten year average (1945-54) of 84 percent. The conditi of cattle was generally good and gained satisfactorily the high quality range feed available.

Joseph R. Glantz

SEVERE STORM APRIL 12 AND 13

A Low moving south-southeastward just off the southe California coast on the 12th and 13th caused heavy show and thunderstorm activity in the southern coastal valley There was considerable snowfall in the mountains, and a sma tornado or decaying waterspout was reported at Chula Vis on the 13th. A vigorous thunderstorm moved northeastwa from offshore to Chula Vista with several reports of a sma tornado occurring about 2:55 p.m. on the 13th which caus considerable damage to a nine-block area extending nort eastward in a strip from South Bay to the Vista Square Scho at 5th and G Streets, the path of damage about one-four to one-half mile long. One eye witness, Mr. William Ber of 497 D Street, Chula Vista, described the storm as follow "The wind was in the shape of a big whirlwind or funne shaped. The roofing and tree limbs that were being carri inside the funnel were rotating counterclockwise. Fr where the wind hit the last house on Otis Street to whe it took the roof off the Vista Square School, it raised o the ground, lowered, and then raised up again." The S Diego Tribune account reported ten fish deposited on t city streets about one mile from San Diego Bay and list 50 houses damaged, 20 of which lost roofing, a 75-foot tr blown down, 300 windows broken, and many folded televisi antennas. Total wind damage was estimated in the vicini of $10,000. Although the decaying waterspout or small to nado was not observed by any weather station, the Navy Weat er Station at Brown Field (Chula Vista) reported a wind 41 m.p.h. at the height of the storm, and at Lindbergh Fie (San Diego) a gust of 43 m.p.h. was observed. Heavy rai in the Los Angeles area on the 12th and 13th caused slid which closed the Topanga Canyon Road from Pacific Coa Highway to Fernwood, and high water and slides temporari closed several other local streets and roads in the L Angeles area. Snow in the mountains closed some roads a made the use of chains necessary on Highway 6, the Rid Route, and Angeles Crest Highway.

REFERENCE NOTES

The four-digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Long-term means from which departures are computed are based on 10 years or more of record ending generally with data for 1950.

Long-term means for full-time stations (those shown in the Station Index as 'U. S. Weather Bureau') are based on the period 1921 - 1950, adjusted to represent observations taken at the present location.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 6:00 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

\- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

° Amounts included in following measurement, time distribution unknown.

\# Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

D Water equivalent of snowfall wholly or partly estimated, using ration of 1 inch water equivalent to every 10 inches of new snowfall.

G In the "Refer to Tables" column in the Station Index the letter "G" indicates Daily Soil Temperatures are published.

M One of more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December ussue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Office Building, 50 Fulton Street, San Francisco 2, California.

Subscription Price: 20 cents per copy, monthly and annual; 2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

MAY 1956
Volume LX No. 5

ASHEVILLE: 1956

WEATHER SUMMARY

A high pressure area extending from Hawaii eastward to the Pacific Coast dominated the weather in California during the last half of the month, but during the first two weeks a series of weather fronts moved eastward across the State causing considerable shower activity. Heavy rains, for May, accompanied a storm center that had moved slowly eastward to within striking distance of the California coast on the 3d. This caused rather heavy precipitation to fall in the central and northern portions and light amounts in the southern portion on the 4th. On the 9th a secondary low formed off the central California coast and produced relatively heavy rains over most of the State. A local tornado-like windstorm occurred in the Los Angeles area on the 9th and a description of this storm will be found at the end of the summary. By the 16th the Pacific High pushed into the western part of Oregon and the resulting east to northeasterly flow of warm, dry air over California caused temperatures to rise to record-breaking proportions along the coast from the San Francisco area, where temperatures in the low 90's were recorded, southward to San Diego. Temperatures in the high 90's were common south of Santa Maria.

More stations reported negative temperature anomalies than positive ones, and the extremes ranged from -3.9° at Soda Springs to +4.7° at Point Piedras Blancas. Cooler weather prevailed generally from the 4th to 13th when mean temperatures fell to as much as 16° below normal, as shown by Weather Bureau stations, and a lesser cool spell occurred during the last week of May with temperatures falling to 9° below normal. White Mountain 2 reported the lowest temperature, 0°, on the 13th. Temperatures rose from the 14th to 22d up to 20° above normal. On the 16th, the 91°-maximum temperature at San Francisco was the highest recorded there since September 1954 and the highest May maximum since the 91° of May 1943. Other stations reporting all-time high May temperatures include Bakersfield with 98° on the 16th, Santa Maria with 93° on the 16th, and San Diego with 87° on the 14th, 91° on the 15th, 92° on the 16th, and 94° on the 17th. Los Angeles also reported a near record high of 99° on the 16th. The high for the month, 114° on the 21st, and the highest monthly mean, 86.7°, were both recorded at Cow Creek. White Mountain 2 reported the lowest mean, 26.5°.

With the exception of the Southeast Desert Basins and the North Coast Drainage, the majority of stations in the other five State divisions reported positive precipitation anomalies. Most of Mays' rains fell from the 3d to 12th as a result of a nearly stationary weak low pressure area centered off the coast containing moist unstable air and sending a series of weather fronts across the State. There were periods of shower and thunderstorm activity after the 17th, but excepting for some local heavy showers, precipitation amounts were relatively light. The 6.11-inch total monthly fall at Blue Canyon, 97 percent of which fell from the 3d to 12th, made it the second wettest May on record there, exceeded only by the 6.69 inches in May 1942. Both Burbank and Sandberg broke their 24-hour total records for May during the 8th and 9th with Burbank measuring 0.95 inch and Sandberg 0.86 inch on those two days. Red Bluff broke its May record of total precipitation, receiving 4.04 inches, 0.93 inch higher than the previous high of 3.11 inches measured in May 1906. In northern and central California, the greatest daily totals were recorded on the 4th when 26 stations measured a fall of 2.00 inches or more. Deer Creek Power House had the greatest 24-hour fall of 2.83 inches. In southern California, heaviest rains fell on the 9th when 23 stations measured 1.50 inches or more and in this area Crystal Lake measured the greatest 24-hour fall of 2.63 inches. Thunderstorm activity was observed for the most part over the State north of the Tehachapis with the accompanying hail causing considerable damage to the cotton crop in a 20-square mile area of Kings County during the week of the 14th to 19th, and hail caused some localized damage to orchards in the Sacramento Valley near the beginning of the month. At Mount Shasta, a thundershower on the 29th dumped 1.43 inches of rain in a one-hour period. Pit River Power House reported the greatest monthly total, 7.05 inches, and there were 17 stations, mostly in the desert regions, reporting no precipitation for the month. Rising temperatures were melting the snowpack. Forty-three inches of snow fell at Twin Lakes from the 3d to 12th, raising the snow depth to a maximum of 70 inches on the 9th. By the 31st there were still 33 inches on the ground. Soda Springs received 24 inches of snow during the same period, but it was practically all melted by the 16th.

According to the U. S. Geological Survey, runoff in northern California streams draining the higher altitudes, was well above median to excessive; foothill streams, however, had receded to low flows. Reservoir storage was generally above average. In southern California, runoff in Santa Barbara, Ventura, Los Angeles, and San Bernardino Counties averaged about 110 percent of median.

According to the California Weekly Weather and Crop Bulletin, conditions in the north and central coastal counties were ideal for the development of all crops, following the widespread rains during the first week. The rains caused some damage to cut hay and lettuce, and temporarily delayed bulk shipment of strawberries because of spoilage; however, the drier weather toward month's end contributed greatly toward the excellent quality and quantity of the crop. A spell of cool, moist weather in Lake County was reported favorable for pear blight, and in Sonoma County orchards for mildew, brown rot, and scab. The damp weather in the Sacramento Valley increased peach curl infestation in a few orchards and aphis infestation in prune trees. Except for drying winds causing some ranges to burn and excessively high temperatures damaging some of the newly planted tomatoes, generally rising temperatures during the remainder of the month resulted in good growth of all crops and enabled haying operations to proceed in full swing. The early rains in the San Joaquin Valley were beneficial to ranges and pastures although they did slightly damage the hay and strawberry crops. The drier weather during the latter part of the month continued favorable to most crops and agricultural activities and benefited spraying operations which had been hampered because of moderately strong winds during the middle of May. Most wind grapes were in full bloom and Thompson seedless grapes were starting to bloom. Ranges above the 4,000-foot level were reported to be the best in several years. The heat wave on the 15th and 16th in the Santa Maria area had a major damaging effect on crops when it opened artichokes, rushed the maturing of broccoli and cauliflower, and burned some cap leaves on lettuce. Lemons were also damaged in the heat in the Santa Barbara area, especially where groves had been sprayed with oil. Walnuts, however, were sizing rapidly and the weather was favorable for sugar beets. Except for the unusually high temperatures in the Los Angeles area (96° on the 15th and 99° on the 16th) and extremely low humidity contributing to some burning of new growth on a variety of vegetation and damaging of some of the new citrus and small deciduous crops, the warm weather at the end of the month advanced grains rapidly toward maturity. Dry, warm weather in San Diego County throughout the month was favorable for most crops and there was sufficient residual soil moisture left from the April rains to permit planting of dry-farmed beans near the beginning of May. Toward month's end the warm weather was excellent for summer fruit and prospects were excellent for crops of pears, peaches, apricots, and apples. Pasture lands were slowly deteriorating, but crops under irrigation were making excellent progress. In Imperial County sugar beets had a high sugar content and alfalfa was about ready for the third cutting. Melons were maturing, cotton was making an excellent stand and barley harvesting was nearing completion. Strong winds during the last week blew some hay out of windrows and caused some slight damage to vines. Otherwise the weather was favorable for crops and harvesting activities.

Joseph R. Glantz

SEVERE WINDSTORMS, MAY 9, 14, and 17

In conjunction with the Low which moved eastward across southern California on the 9th causing extensive shower activity, a small tornado was reported at Alhambra, California. There were several newspaper interviews describing a funnel cloud which dipped down to the surface uprooting trees and damaging about 20 homes in a narrow strip along Winthrop Drive about three blocks long between Poplar and Commonwealth Streets in Alhambra. Confirmed reports described the loud sound of the tornado similar to a train coming closer and closer. Primary damage to the homes along Winthrop Drive was tile and other materials blown from roofs broken windows, and downed television antennas. There was little wind either before or after the small tornado struck for about one minute at 8:20 a.m. Pacific Standard Time. Damages were estimated at about $25,000.

Santa Ana winds toppled many television antennas, broke branches from trees and blew down several signs in the Los Angeles area on the 14th.

High winds caused more widespread damage in the Los Angeles area, primarily the Pasadena-Alhambra-Whittier area on the 17th, when many trees were blown down and roofs damaged. A 30 x 60-foot corrugated iron and wooden shed at 3747 E. 26th St., Los Angeles, collapsed over six trucks and cars with resulting damage estimated at $10,000.

REFERENCE NOTES

The four-digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Long-term means from which departures are computed are based on 10 years or more of record ending generally with data for 1950.

Long-term means for full-time stations (those shown in the Station Index as 'U. S. Weather Bureau') are based on the period 1921 - 1950, adjusted to represent observations taken at the present location.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 6:00 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are publisehd later in Hourly Precipitation Data.

D Water equivalent of snowfall wholly or partly estimated, using ration of 1 inch water equivalent to every 10 inches of new snowfall.

G In the "Refer to Tables" column in the Station Index the letter "G" indicates Daily Soil Temperatures are published.

M One of more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Office Building, 50 Fulton Street, San Francisco 2, California.

JUNE 1956
Volume LX No. 6

ASHEVILLE: 1956

WEATHER SUMMARY

The weather over the State proved to be average for the month as no unusual storms of any type were reported. Some thunderstorm activity was observed in northern portions on the 1st, 2d, and 3d, again in local areas in and near the mountains on the 13th, 14th, and 15th, and during the week of the 18th in Tehama County when hail caused some damage to grains about to be harvested. The fire danger in the State forest lands was relatively low all month due to unseasonably heavy rains in May, and to the absence of any prolonged heat wave in June. Temperatures rose considerably at month's end from the 25th to 29th when most stations reported their monthly maximums. There were an unusually large number of clear days, especially in coastal areas, with many stations reporting above average percent of possible sunshine. Some examples include: Eureka had its highest June value since 1950, 68 percent; San Francisco's 89 percent was 14 percent above its June average; Los Angeles had 75 percent; and San Diego 65 percent. Fresno reported 100 percent possible sunshine.

Temperature anomalies were a little on the positive side in southern California, ranging for the most part from 1° to 3°, and were mostly on the negative side in the North Coast Drainage ranging from -1° to -2°. Over the remainder of the State, anomalies varied from small negative to small positive values. Cooler than normal weather, as shown by Weather Bureau stations, occurred on the 4th, 5th, and 6th, and again generally from the 13th to 20th when daily mean temperatures were 5° to 10° below. The warmest period was from the 26th to 29th when temperatures were up to 15° above normal. Cow Creek reported the maximum for June, 125° on the 28th, and the warmest spot outside the desert areas was Avenal where 115° was recorded on both the 28th and 29th. The highest monthly mean, 96.8°, also occurred at Cow Creek. The lowest mean, 38.7°, and the low for the State, 17° on the 15th, were reported by White Mountain 2 at an elevation of 12,470 feet.

Precipitation anomalies, for the most part, were negative over the State as nearly all of the measurable precipitation occurred in the northern half. Weak low pressure troughs moved across northern California during the week of the 2d and brought light showers to the extreme northern portions and northern ranges of the Sierras. Two relatively weak storm fronts passed across the State, one on the 14th causing light showers and drizzles as far south as Monterey and thunderstorms in the mountains, and the other on the 19th resulting in a similar precipitation pattern. The maximum 24-hour catch, 1.43 inches, fell at Tennant on the 14th and Crescent City 7 ENE had the greatest monthly fall, 2.68 inches. As the July 1, 1955 to June 30, 1956 season ended, the following is a brief resume of the amount of precipitation that had fallen. In northern California most stations received more than 100 percent of their normal seasonal fall, as shown by Weather Bureau stations: Eureka 120 percent; Red Bluff 132 percent; Mt. Shasta 150 percent; San Francisco 132 percent; and Blue Canyon where the season's total was 99.83 inches, received 187 percent. In southern portions of the State except for Burbank where 103 percent and Los Angeles where 129 percent fell, there was a deficiency in the seasonal totals with Santa Maria receiving 89 percent, Bakersfield 61 percent, and San Diego only 42 percent.

According to the U. S. Geological Survey Report, runoff for June was excessive in streams fed by high altitude snowmelt but was about median in foothill streams and less in southern California. Most reservoirs were nearly full except in the southern part of the State.

The California Weekly Weather and Crop Bulletin reported that the sunny and warm weather speeded crop growth and rapidly ripened fruit in north and central coastal counties where cherry picking was in full swing. However, high temperatures at month's end reduced somewhat the yield prospects of the bush berry crop in Sonoma County and caused some sunburn damage to apples. There was also some damage to apricots, walnuts, and some bush berries as a result of the heat, but the extent could not be immediately evaluated. Showers during the middle of the month in the upper Sacramento Valley wet down considerable acreages of cut hay, and the accompanying hail also damaged an estimated 2,000 acres of grain. Fortunately the peach crop, walnuts, almonds, and olives were in good production following the hail damage. Spraying and dusting were occasionally hindered because of some windy periods in the San Joaquin and Sacramento Valleys; however, both the aphis population and spider mites on pears were under control in most producing areas. Warm daytime temperatures were ideal for exceptional growth of cotton in the San Joaquin Valley and the warm day- and nighttime temperatures had the same result on cotton in Imperial County. In the Los Angeles area mostly cool weather with cloudy mornings and sunny afternoons in coastal, and sunny hot weather in interior areas, were favorable to farm activities although the cloudiness slowed down the growth of vegetation near the coast. In San Diego County harvesting of all crops proceeded satisfactorily and the picking of Thompson seedless grapes in Borrego Valley was in progress. The high temperatures at month's end greatly increased the demands for irrigation in southern California and was primarily responsible for the increase in the number of grasshoppers which caused some trouble to bean and grain crops in the Santa Maria area.

The California Livestock and Range Report indicated forage supplies on ranges were generally better than average for this season. Late spring rainfall was very beneficial to native ranges and pastures and supplies of cured forage exceeded earlier expectations considerably. The southern coastal ranges below Los Angeles received only limited relief from late scattered rainfall and moisture supplies remained greatly depleted. Stock water supplies however, were generally very good. The reported condition of cattle and calves at 85 percent was two points above a year ago and equal to the 10-year (1945-54) average. The reported sheep and lamb condition at 88 percent was one point above the 10-year average and five points above a year ago.

CORRECTED DATA

JUNE 1944	WILLIAMS AS	CLIMATOLOGICAL DATA TABLE: Monthly mean temperature should be 69.5° and lowest temperature 40° on 16th.
NOVEMBER 1954 through DECEMBER 1955	OAKLAND CITY HALL	TABLES 2, 3, and 5: Delete entire temperature and precipitation record for period indicated.
NOVEMBER 1955	SAN PEDRO	TABLES 2 and 3: Precipitation on 14th should be .72, monthly total 1.16, departure .28, greatest day .72 on 14th, days with .10 or more 3, and .50 or more 1.
DECEMBER 1955	ANTIOCH PUMPING PLT	TABLE 6: Evaporation on 6th should be accumulated (*), 7th .08, 28th .05, and monthly total 2.01.
	GARBERVILLE	TABLE 3: Precipitation on 22d should be accumulated (*) and 23d should be 6.75, monthly total 25.29.
	GROVELAND RS	TABLE 3: Precipitation on 23d should be 6.30+ since capacity of gage was 6.30 inches and may have overflowed. (Groveland 2 recording precipitation station for same period, ending 5 p.m. 23d was 6.69 inches.)
	MARE ISLAND (SOLANO COUNTY)	SUPPLEMENTAL PRECIPITATION DATA, Page 345: Precipitation on 24th should be .02.
MARCH 1956	JOICE ISLAND	TABLE 6: Prorated evaporation on 31st should be .37 and monthly total 4.82.
	NEWARK	TABLE 6: Prorated wind movement on 31st should be 100 and evaporation .17. Monthly wind movement total should be 1779 and evaporation 4.20.
	PLACERVILLE IFG	TABLE 6: Prorated evaporation on 31st should be .07 and monthly total 3.52.
APRIL 1956	FINLEY	TABLE 3: Delete entire record. See Delayed Data for complete record.
	KERN RIVER PH 1	TABLES 2 and 5: Max temperature on 26th should be 77°, mean max 74.4°, mean 63.7°, departure -0.3°, and total degree days 123.
	LOS BANOS	TABLES 2 and 5: Max temperature on 11th should be 55°, mean max 74.7°, mean 59.9°, departure -1.9°, and total degree days 167.
MAY 1956	HARRISON GULCH RS	TABLE 3: Precipitation on 31st should be .00 and monthly total 2.52.
	HAYFORK RS	TABLE 3: Precipitation on 31st should be accumulated amount, .32 for 30th and 31st, monthly total 2.49.
	MANDEVILLE ISLAND	TABLE 6: Prorated wind movement on 31st should be 199 and monthly total 6028.

REFERENCE NOTES

Additional information regarding the climate of California may be obtained by writing to the State Climatologist at Weather Bureau Office 567 Federal Office Building, 50 Fulton Street, San Francisco 2, California, or to any Weather Bureau Office near you.

The four-digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Long-term means from which departures are computed are based on 10 years or more of record ending generally with data for 1950.

Long-term means for full-time stations (those shown in the Station Index as 'U. S. Weather Bureau') are based on the period 1921 - 1950, adjusted to represent observations taken at the present location.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown in footnote following Table 6.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 1 30 a.m., PST, except for Bishop WB AP which is 6:00 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

D Water equivalent of snowfall wholly or partly estimated, using ration of 1 inch water equivalent to every 10 inches of new snowfall.

G In the "Refer to Tables" column in the Station Index the letter "G" indicates Daily Soil Temperatures are published.

M One of more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 20 cents per copy, monthly and annual; 2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

JULY 1956
Volume LX No. 7

ASHEVILLE: 1956

WEATHER SUMMARY

The presence of rather persistent east to southeasterly winds at upper levels from the 17th to 29th over the southwestern portion of the United States resulted in widespread thunderstorm activity in the mountains and interior regions of southern California, and contributed to the formation of an unusual number of thunderstorms in the northern half of the State. Sections along the coast especially from Santa Maria to the San Francisco Bay area were also subjected to thunderstorms on the 18th and 19th. This was only the third time that such an occurrence was reported in July at Santa Maria since 1943 and also the third one reported at Oakland in July since 1931. Blue Canyon had six thunderstorms, the largest number ever reported in July, and numerous fires were attributed to lightning in Tahoe National Forest. Only a trace of rain, however, was reported all month at the station. Thunderstorms also occurred at Mt. Shasta on the 1st, 2d, 10th, 11th, 19th, 23d, and 26th; however, only on the 10th when 0.48 inch of rain fell, was the accompanying precipitation of any consequence. A description of the storms will be found at the end of this summary. Although temperatures were for the most part cooler than expected for the month, as shown by individual reporting stations, there were instances of local heat waves when both the maximum and minimum temperatures were considerably above daily averages. Except for locally strong and gusty winds accompanying thunderstorms, and for the fairly strong winds in the Sacramento area on the 12th, there was no appreciable windiness during any single day. However, the monthly average windiness at Sacramento airport was 32 percent above the 78-year mean. Wind speeds exceeded 17 m.p.h. on 18 days of the month, and the fastest mile, 36 m.p.h. on the 12th, established a new July record.

Temperature anomalies over California were generally on the negative side except in some sections along the coast south of San Francisco; in an area in the Sierras bordered by Colfax to the south and Canyon Dam to the north; in a small section in the northwest, inland from Crescent City to Yreka; and in a few isolated sections scattered over the State. Individual anomalies ranged from +3.9° at Elk Valley on the Oregon border to -4.9° at Tehachapi in southern California. Temperatures were up to 11° above normal from the 17th to 26th. They were as much as 16° below normal from 1st to 5th, and dropped to 12° below from the 12th to 16th, mostly in the Sacramento and San Joaquin Valleys. All these values were based on Weather Bureau Airport station normals. At Sacramento the unusually low maximum temperature for July, 71°, was recorded on the 12th, the lowest ever recorded for that date since daily records began in 1877. Fresno's 51°-minimum temperature was the coldest July temperature ever recorded there. On the other hand, daily maximum temperature records on both the 18th and 22d were broken at Red Bluff when 112° and 111° were recorded, respectively. The 10 consecutive days from the 17th to 26th, with minimum temperatures 70° or higher was also only exceeded by the 18 consecutive days of the same occurrence in 1896. Mt. Shasta reported that the 10 consecutive days with maximums 90° or higher from the 16th to 25th was the longest such period for July since 1939. Coastal areas, however, generally from San Francisco northward, remained relatively cool as an unusual amount of low cloudiness reduced the sunshine. San Francisco reported only 53 percent of possible sunshine, 15 percent below average, and Eureka reported 41 percent, 9 percent below average. Station maximum temperatures occurred mostly from the 17th to 24th, excepting in the Southeastern Desert Basins where they generally occurred during the first 10 days of July. The highest temperature in the State was 121° recorded at Cow Creek on the 9th and at Greenland Ranch on the 10th. White Mountain 2, at an elevation of 12,470 feet, recorded the lowest temperature, 22°, on the 2d. The highest temperature outside the Death Valley area was 113° on the 23d at both Five Points 5 SSW and Panoche Junction. Monthly mean temperatures ranged from a high of 99.6° at Cow Creek to a low of 43.7° at White Mountain 2.

Except for drizzles associated with the considerable low cloudiness along coastal sections, most of the State's rain occurred in conjunction with thunderstorms in the form of rather heavy showers in some localities. Measurements of over an inch of rain during any 24-hour period were not recorded by any stations in the North Coast, Central Coast, and San Joaquin Drainages, and only to a limited extent at stations in the remainder of the State. All occurrences of an inch or more of rain in any 24-hour period were noted during the period 20th to 28th, and in some instances this daily total represented nearly the entire month's fall. Of the 1.74 inches that fell at Barstow, 1.72 inches were measured on the 25th, most of which fell between 6:00 p.m. and midnight of the 24th. Riverside Fire Station measured a total monthly fall of 1.26 inches on the 25th. White Mountain 1 measured the greatest monthly total, 3.30 inches, an accumulation of daily falls from the 18th to 29th. Hail accompanied many of the thunderstorms, and lightning caused numerous forest fires which, in many instances, were prevented from spreading by accompanying rain. At Mt. Shasta hailstones up to 3/4 inch in diameter were observed on the 10th, but the storm was sufficiently short and covered only a small area so that damage to fruit and shrubs was slight. The numerous thunderstorms in the mountains near Bishop dropped little rain there, but the resulting warm weather accelerated the melting of ice and snow in the Sierras and caused heavy runoff on the eastern slope.

According to the U.S. Geological Survey, runoff in California ranged from generally excessive throughout most of the northern portion to deficient in southern California. Storage in most reservoirs remained at a high level. Water levels in key wells in the southern part remained at or near record-low stages.

The California Weekly Weather and Crop bulletin reported that cloudy weather along the north and central coastal counties slowed growth of most crops, but inland the weather was generally favorable for crops and outside activities. The foggy weather developed high color in Gravenstein apples that were about to be harvested in Sonoma County. The rather frequent days of cool weather in the Sacramento Valley prevented blight or sunburn in walnuts, but slowed peach ripening and favored the increased activity of pests. In one of the worst grasshopper invasions in 15 years, entomologists reported the grasshopper population ranging from 7 or 8 per square yard in Sacramento County to 500 per square yard in heavily infested portions of Tehama County north of Red Bluff. Hot weather toward month's end in the San Joaquin Valley speeded the ripening of peaches, but may have decreased the quality of the fruit. The heat also caused some top burning of corn in Madera County and increased the insect population. In Fresno County lygus bugs, bollworms, and mites required control in cotton fields, and aphis were building up fast in alfalfa in most areas. High humidities, however, favored alfalfa cutting and reduced leaf shatter to a minimum. Below average to average temperatures in the Los Angeles area were very favorable for good growth of all crops. The new crop of citrus fruit sized rapidly and harvesting and canning of a good quality and quantity of decidous fruit was in progress. Peaches, plums, and apricots were being picked in San Diego County with the size of the fruit generally good and quality excellent. In Imperial County cotton continued to make good progress and a slight amount of early cotton had been picked. Frequent windy days interfered with spraying and dusting operations during the week preceding the 30th.

Range and pasture feed conditions were generally above average. Mountain ranges were exceptionally good as recent thundershowers had nearly assured a good season. No large range fires had been reported all month. The reported average condition of cattle at 84 percent was 3 points above July 1955 and equalled the ten-year average.

JULY 1956 SEVERE STORMS

Southeasterly flow of humid subtropical air associated with low pressure aloft along the Pacific coast and high pressure over the southwestern United States from the 17th to 29th caused scattered thunderstorm activity over much of California with some local flash floods reported in the southeastern interior desert and mountain areas.

Some of the first thunderstorm activity in the series began in the Santa Clara Valley and Santa Cruz Mountains the evening of the 17th. Although there was little precipitation there was an unusual display of lightning which included most of the San Francisco Bay area on the 17th and 18th and Lake County on the 19th. The lightning started brush and forest fires and caused some damage to communication and power systems in the San Francisco Bay area, probably the heaviest occurring at St. Helena where lightning struck a P G & E substation at 5:40 a.m. on the 19th leaving the town without electricity for about five hours. Transformers or powerlines were also damaged at Clear Lake, Martinez, Ukiah, Lakeport, Calistoga, Morgan Hill, and Gilroy. Although there had been isolated thunderstorms in the Cascade - Sierras earlier in the month scattered thunderstorms became general in the mountains and southeastern desert areas about the

(a) SANDY LOAM -- UNDER BARE GROUND SURFACE. (b) RAMONA SANDY LOAM -- BARE GROUND, EXPOSED TO THE SUN. (c) RAMONA SANDY LOAM -- UNDER THE EAST SKIRT OF A VALENCIA ORANGE TREE, SHADED AND UNDER REGULARLY IRRIGATED SOIL. IRRIGATION WATER ON 18 INCH DEPTH AT 8 A.M. JULY 16 TO JULY 18.

HERETOFORE, THE AVERAGE TIME ESTIMATION HAS BEEN READ DIRECTLY FROM THE THERMOGRAPH CHART. HOWEVER, THE SOIL PEN LAGS THE TIME INDICATED ON THE CHART BY FOUR HOURS. COMMENCING THIS MONTH (JULY) THE ADJUSTED TIME IS TALLIED. ON ALL PREVIOUS RECORDS (i.e., JANUARY - JUNE 1956) A CORRECTION OF PLUS 4 HOURS SHOULD BE APPLIED TO ALL "TIME" DATA.

WEATHER SUMMARY (Continued)

18th and 19th and continued through the 29th with unusually warm weather in this period. Eleven consecutive days with thunderstorms were reported at Bishop from the 19th through 29th, and at Cow Creek, Death Valley, from the 18th through 28th.

A local heavy shower caused slides closing Highway 108 at 3:10 p.m. on the 20th about five miles west of its junction with U. S. 395. The highway was officially opened the morning of the 23d. On that same day 1.23 inches of rain fell at Twin Lakes in about two hours and 0.92 inch fell in about one hour at Yosemite National Park. Heavy rainfall was reported in the Lucerne Valley and Apple Valley area, and at Barstow 1.72 inches of rain fell mostly between 6:00 p.m. and midnight of the 24th, causing some local flooding. Thunderstorms caused flash floods at Deep Springs School, Inyo County, which washed out some roads on the 25th, and on the 27th a flash flood swept down Barton Flat Creek, isolating a dozen summer camps for more than 14 hours and temporarily closing Barton Flats road and Seven Oaks road with mud and rocks.

Forest Service officials estimated more than 600 forest fires were started in California by lightning strikes in the July 17 - 29 thunderstorm period with costs of fire suppression estimated near half a million dollars. Rain falling from the thunderstorms over the Cascade-Sierras helped greatly, however, and almost all fires were out or under control by the end of the storm period.

Robert F. Dale
State Climatologist
U. S. Weather Bureau
San Francisco, California

REFERENCE NOTES

Additional information regarding the climate of California may be obtained by writing to the State Climatologist at Weather Bureau Office, 557 Federal Office Building, 50 Fulton Street, San Francisco 2, California, or to any Weather Bureau Office near you.

The four-digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Long-term means from which departures are computed are based on 10 years or more of record ending generally with data for 1950.

Long-term means for full-time stations (those shown in the Station Index as 'U. S. Weather Bureau') are based on the period 1921 - 1950, adjusted to represent observations taken at the present location.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 6:00 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are publisehd later in Hourly Precipitation Data.

D Water equivalent of snowfall wholly or partly estimated, using ration of 1 inch water equivalent to every 10 inches of new snowfall.

G In the "Refer to Tables" column in the Station Index the letter "G" indicates Daily Soil Temperatures are published.

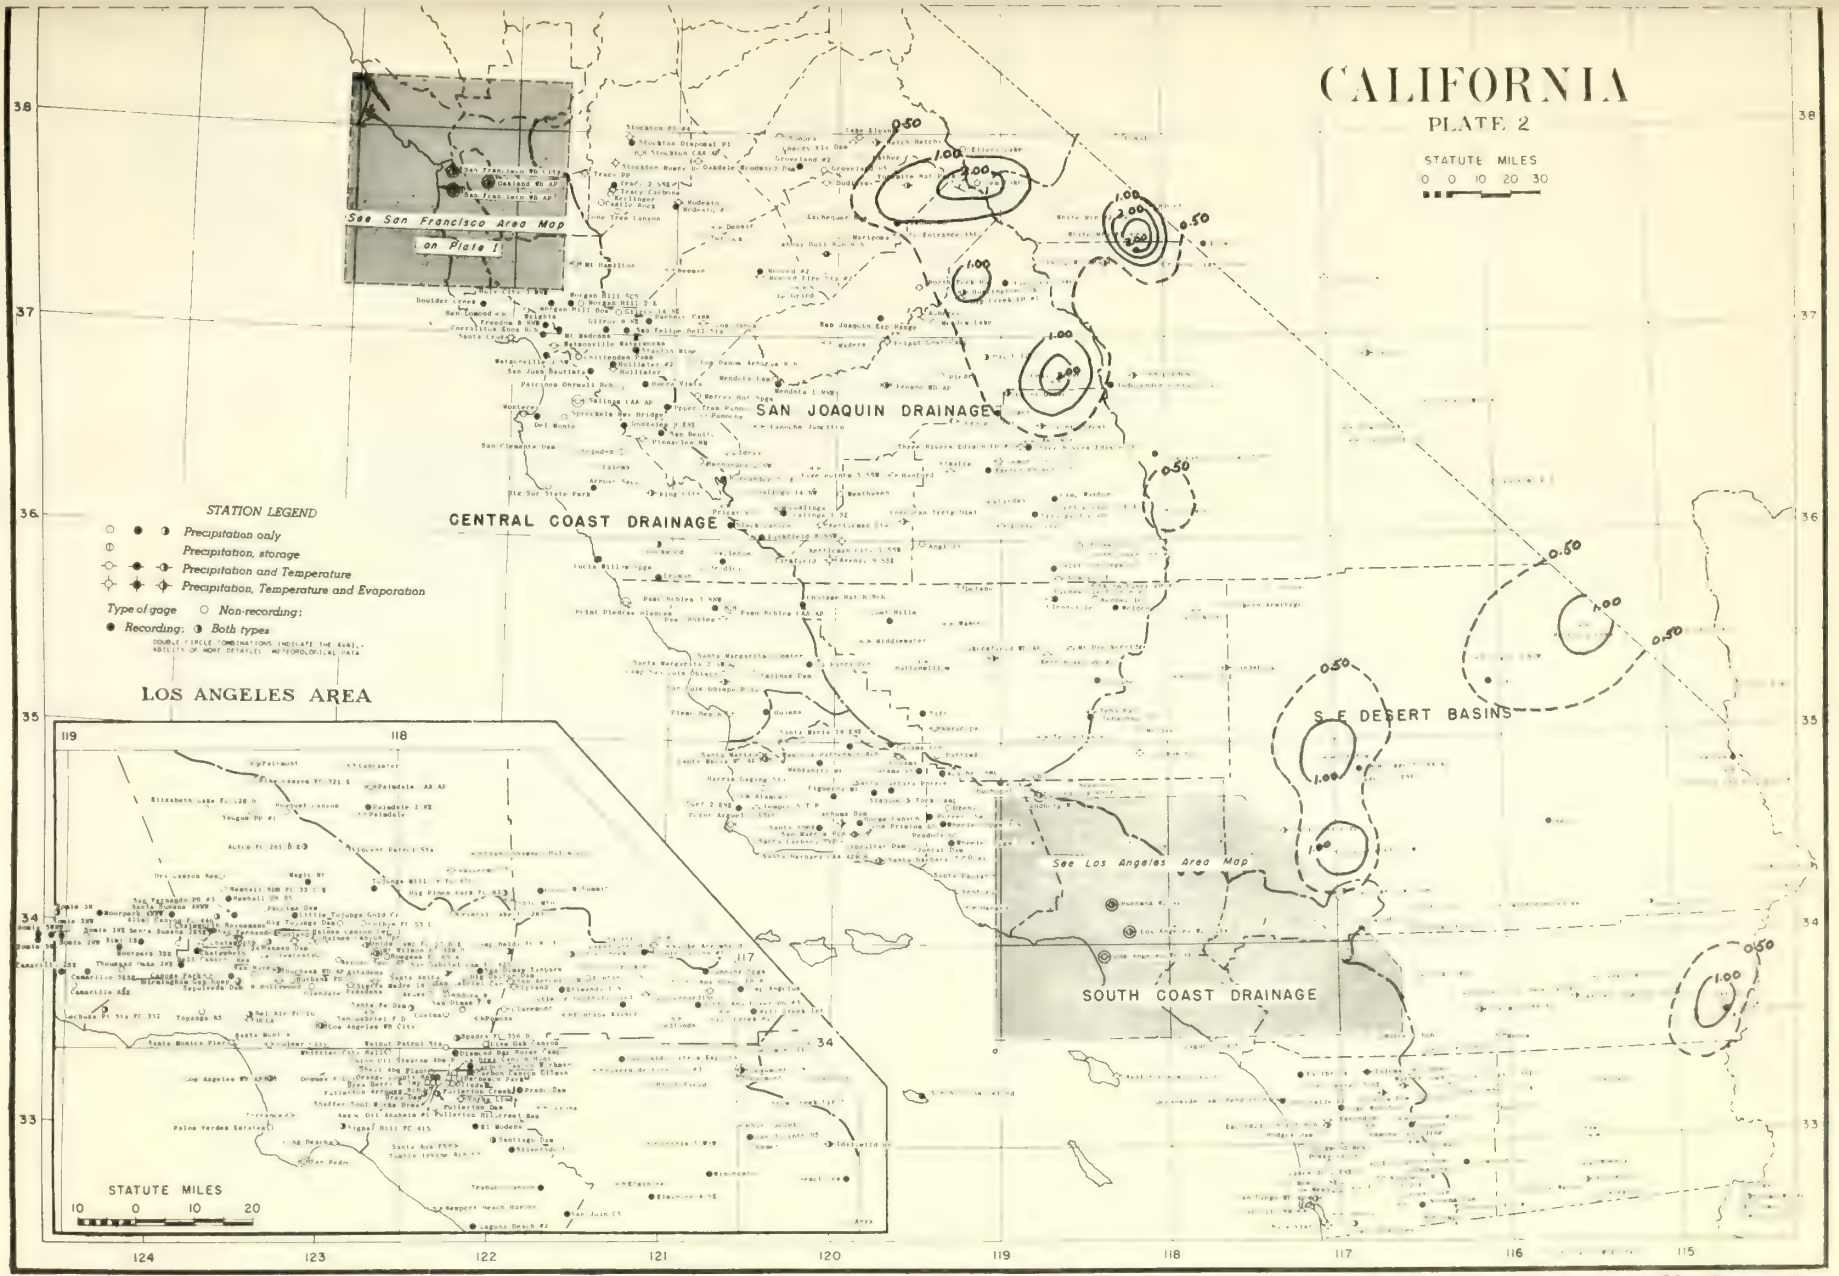
M One of more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.



V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 20 cents per copy, monthly and annual; 2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

DOUBLE CIRCLE COMBINATIONS INDICATE THE AVAILABILITY OF MORE DETAILED METEOROLOGICAL DATA.

In this issue of the Climatological Data for California there is inaugurated a new presentation of precipitation and temperature data for the State. In January 1956, the decision to abandon the state means of temperature and precipitation was reached after careful consideration and consultation with the Advisory Committee on Climatology. Political subdivisions generally bear no relation to natural regions of topography, vegetation or atmospheric circulation, and averages of climatic data over such areas do not form a valid time series. In addition the number and location of stations change from year to year. The charts presented herein give a general picture of precipitation and temperature over the State.

AUGUST 1956
Volume LX No. 8

ASHEVILLE: 1956

CALIFORNIA - AUGUST 1956

WEATHER SUMMARY

The month was cooler than usual and precipitation was light in northern California and almost non-existent in southern California. Some thunderstorm activity was reported, especially in the mountain areas; however, the accompanying rainfall was generally light as no station measured over a half an inch of rain during any 24-hour period. Lightning associated with the thunderstorm activity caused local brush and forest fires, but fortunately they were all brought under control before any serious damage resulted. Scattered occurrences of hail near the end of the month in the Fall River and McArthur areas of Shasta County caused spotty damage to crops. Along coastal areas the percent of possible sunshine, as reported by stations with sunshine recorders, was nearly five percent above average from San Francisco northward and nearly five percent below average south of San Francisco.

Temperature anomalies in California were generally negative with the greatest departures occurring in the interior regions, ranging from -2° to -4°, the greatest departure being the -7.1° at Tehachapi. Coastal area departures, however, were just slightly above or below zero degrees. According to stations with 30-year daily normals, the month started out cool with temperatures as low as 14° below normal during the first five days. One other cool period was noted from the 11th to 16th when temperatures were near 11° below normal. The rest of the month varied as temperatures were slightly above or below daily normals. A hot spell of short duration struck southern California on the 22d and 23d with maximum temperatures of from 105° to 115° being recorded at stations in coastal and interior valleys. Monthly maximum temperatures occurred during a variety of days in northern California, but a large number of stations recorded them from the 10th to 14th. The highest temperature in the State was the 120° recorded at both the Death Valley stations -- Cow Creek on the 23d and Greenland Ranch on the 24th. The highest temperature outside the desert regions was the 115° at Sunland on the 23d. Mt. Shasta reported that the maximum temperatures on both the 1st and 2d were the lowest for August since 1908, and the monthly maximum at Santa Maria Weather Bureau Airport station, 76°, was the lowest recorded there in August in 14 years. Julian Wynola recorded the lowest temperature for the month, 27°, on the 3d. Monthly mean temperatures ranged from a high of 97.1° at Greenland Ranch to a low of 42.7° at White Mountain 2.

Precipitation was light, even for August, as only four stations measured over a half an inch of rain for the month: Callahan Ranger Station, 0.53 inch; Oak Knoll Ranger Station, 0.54 inch; Yreka, 0.62 inch; and Mt. Hebron 9 E, 0.70 inch, the highest in the State. The greatest 24-hour catch was 0.48 inch also at Mt. Hebron 9 E on the 19th. Of the 577 stations in California reporting for the month, only 12 percent received measurable precipitation, and nearly all of them were located in the northern half of the State. No rain was reported in the San Joaquin Valley and except for the 0.13 inch at Needles on the 13th, practically no rain fell in southern California.

According to the California Weekly Weather and Crop Bulletin moderate temperatures and morning fogs generally favored crops in the north and central coastal areas although the damp weather did delay the tomato harvest in Santa Cruz County. Harvesting of large crops of prunes, apples, pears, and pole beans continued at a rapid rate. Occasional periods of above average temperatures in the Sacramento Valley favored the increase in the aphis population in alfalfa, and some hayfields also became heavily infested. However, the overall cool weather was very favorable to all crops. A near-record crop of pears was at the peak of harvest in El Dorado County, and Elberta and Hale peach harvests were completed in most sections. In the lower San Joaquin Valley many crops were maturing ahead of schedule, with grapes one to two weeks early in Madera County. Warm weather near mid-month, however, increased the ravages of various crop pests, particularly the spotted alfalfa aphis and pink root fungus in onions. Watermelon quality in San Joaquin County was good, although the crop was reduced somewhat by the hot weather in July. The harvesting of sugar beets started in Kern County and the first bale of cotton was picked in the Wheeler Ridge area. Continued cool weather in the Santa Maria area was detrimental to the quality of lettuce now being harvested, but had no adverse effect on other crops and harvesting activities. The weather was favorable to all crops in the Los Angeles area; however, the unusually high temperatures on the 22d and 23d accelerated the maturing of crops and increased the need for irrigation. Weather conditions were generally favorable for crops in the San Diego area where large amounts of good tomatoes were being harvested. Despite the dry winter, dry lima beans were making good progress in coastal areas. Cotton in Imperial County was reported to be in excellent condition. Fairly strong winds at month's end caused light damage to cotton foliage; however, satisfactory progress was being made in general. Spraying and dusting were continued to curb insect activity.

The California Livestock and Range Report stated that summer pastures and ranges were generally supplying satisfactory amounts of livestock feed. Supplies of dry feed on fall ranges were adequate for normal fall use and should provide good cover for new grass. The reported average condition of all pasture and range feed at 81 percent was four points above August 1955 and five points above average. Cattle and calves at 84 percent were three points above August 1955 and one point above average.

REFERENCE NOTES

Additional information regarding the climate of California may be obtained by writing to the State Climatologist at Weather Bureau Office, 557 Federal Office Building, 50 Fulton Street, San Francisco 2, California, or to any Weather Bureau Office near you.

The four-digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Long-term means from which departures are computed are based on 10 years or more of record ending generally with data for 1950.

Long-term means for full-time stations (those shown in the Station Index as 'U. S. Weather Bureau') are based on the period 1921 - 1950, adjusted to represent observations taken at the present location.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 6:00 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

– No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

\# Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are publisehd later in Hourly Precipitation Data.

D Water equivalent of snowfall wholly or partly estimated, using ration of 1 inch water equivalent to every 10 inches of new snowfall.

G In the "Refer to Tables" column in the Station Index the letter "G" indicates Daily Soil Temperatures are published.

M One of more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

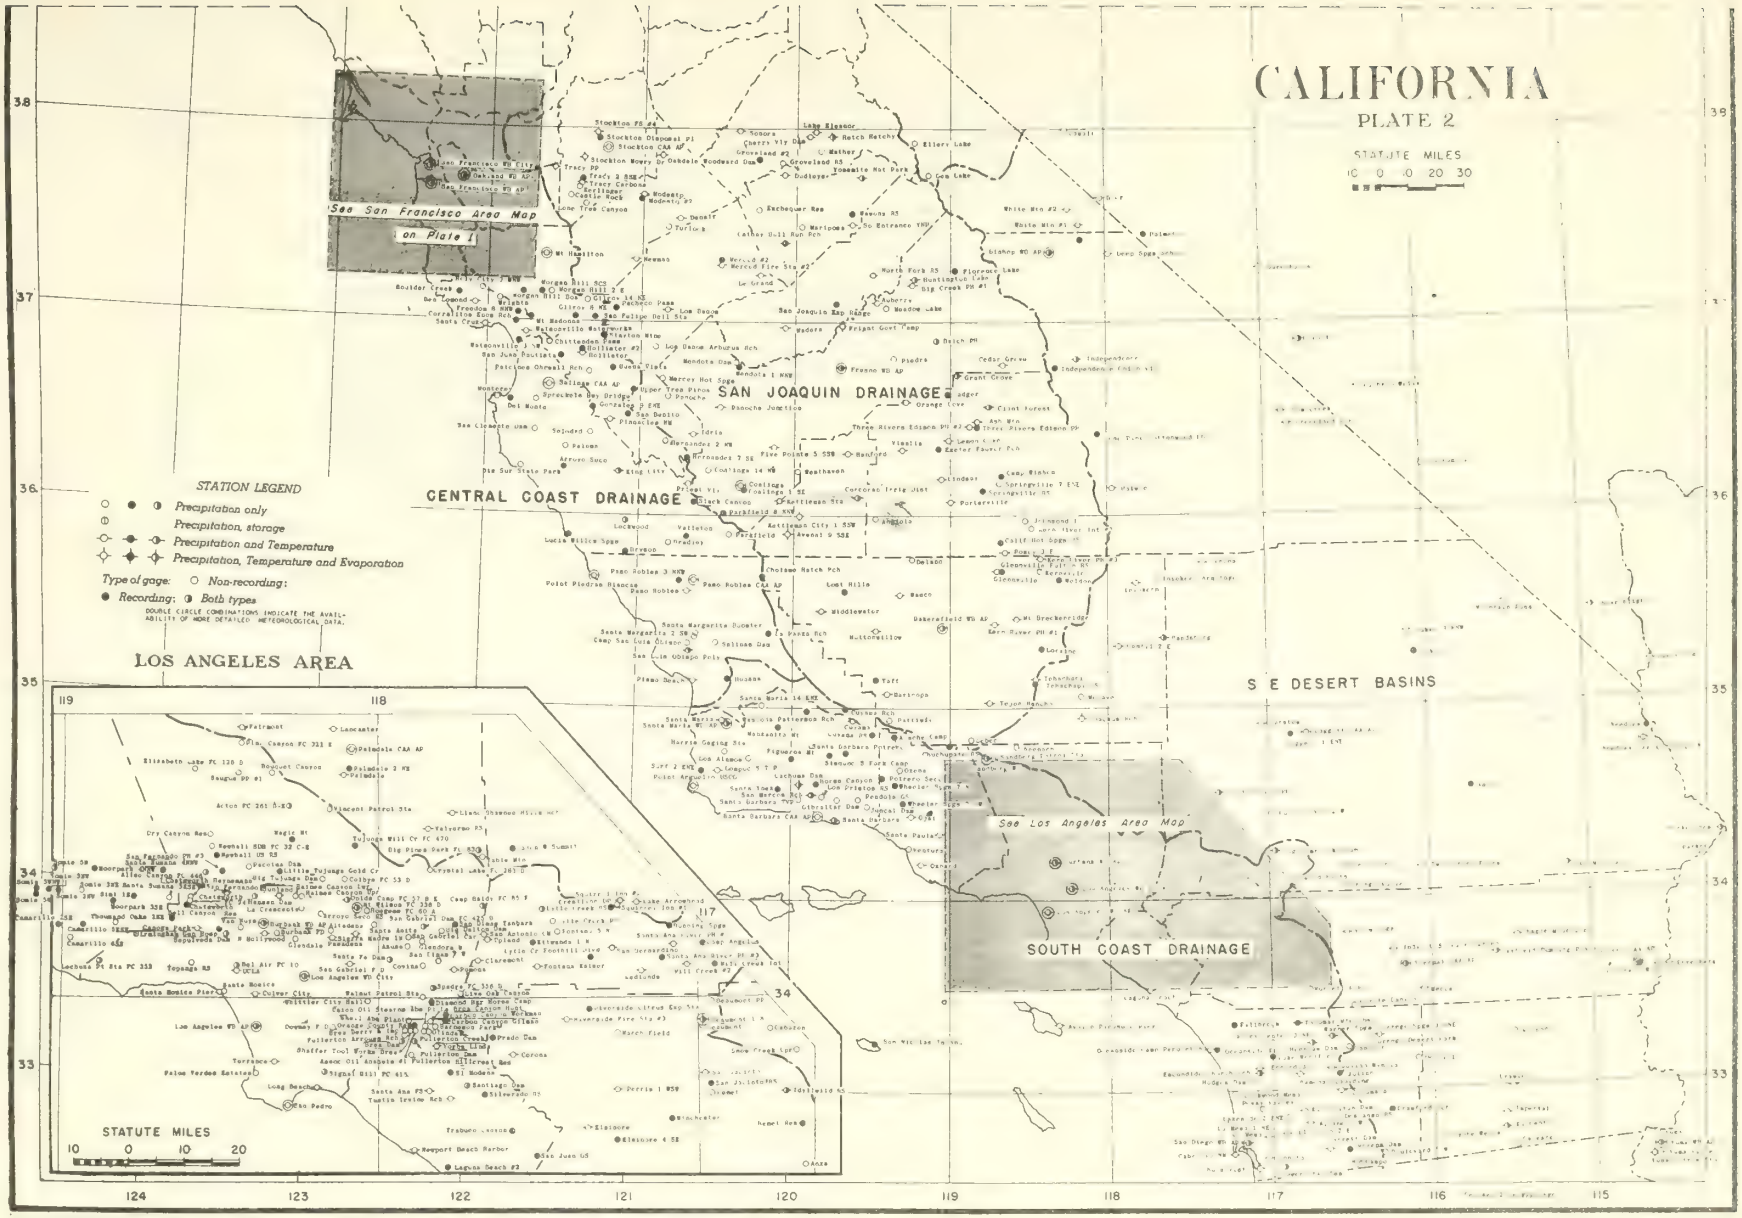
S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.



Subscription Price: 20 cents per copy, monthly and annual; 2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

CALIFORNIA

SEPTEMBER 1956
Volume LX No. 9

ASHEVILLE: 1956

WEATHER SUMMARY

The weather over the State was quite variable as many stations north of the 36th parallel received an exceptional amount of rain for September and all stations in the southern half received subnormal amounts. On the 18th and 19th the flow of air from the southwest around a Low off the California coast coupled with a tropical storm off the Mexican coast produced a narrow band of moisture over central California causing light to moderate thunderstorm and shower activity over the central part of the State. This resulted in as much as ten times the average September rainfall at some stations in the lower Sacramento - San Joaquin Valleys. Toward the end of the month the presence of additional southwesterly winds at upper levels brought some more scattered but considerably lighter showers in the northern and central portions of the State, and was responsible for very warm weather in southern California. Nearly every station in the State having sunshine recorders reported above-average percent of possible sunshine, rising to as much as 17 percent above average at both Los Angeles and San Diego, the latter establishing a new September record with 87 percent. Some frost was observed at higher elevations near Mt. Shasta on the 13th and 22d, but little damage was reported. More extensive damage to gardens, flowers, and shrubs, however, was reported at Weed on the 22d as a result of a local killing freeze.

Temperatures, as shown by Weather Bureau stations, were up to 7° above daily normals during the first six days of September north of the Tehachapis, and rose up to 10° above during the last eight days. Coastal areas were exceptions to this rule as local above-normal temperatures occurred during various intervals throughout the month. Temperature anomalies in this same northern area were quite variable although mostly on the positive side as they ranged from -3.5° at Hat Creek Power House 1 to +4.7° at Elk Valley. South of the Tehachapis above daily normal departures were evident on nearly every day of the month, rising up to 14° above on the 9th and 10th and up to 16° from the 24th to 29th. Temperature anomalies were positive at most stations with a great number of them having values exceeding 5.0° -- the greatest being 8.4° at Escondido Church Ranch. However, a few coastal and mountain stations did show negative anomalies. Some examples of the abnormal temperatures include: Burbank had its warmest September on record, Los Angeles and San Diego both had their second warmest on record; compared to the average of 4 days with 90° or higher for September, Los Angeles had 14 days, and Burbank had 22 days with 90° or higher compared to an average of 12 days; and this was the first month since January 1956 that Fresno and Santa Maria experienced above-average monthly temperatures. The highest temperature in the State, 117°, was recorded at Cow Creek on the 2d and Indio U. S. Date Garden on the 18th. In areas outside the South East Desert Basins, the monthly high was 109° reported at Avenal on the 4th, Sunland on the 9th, and Escondido Church Ranch on the 10th. In contrast to all this warm weather, Red Bluff had its coolest September since 1941. During the 51-day period August 11th to September 30th maximum temperatures stayed below 100° for the first time since 1925. Boca reported the lowest temperature in the State, 18°, on the 17th. Monthly mean temperatures ranged from a high of 93.7° at Cow Creek to a low of 46.3° at White Mountain 1. (The September report from White Mountain 1 was received too late to be published in this issue and will be found in the "Delayed Data" section of the December 1956 publication.)

Most of the State's rain fell north of the 36th parallel, generally on the 18th, 19th, and 20th, when totals exceeding an inch were measured during a 24-hour period at many stations. All these stations were in the Sacramento Drainage and generally in an area bordered by Bullards Bar Power House to the south and Manzanita Lake to the north. A few stations north of Yosemite National Park also measured slightly over an inch of rain. The greatest monthly total in the State was 1.66 inches at Westwood 3 WSW and the greatest 24-hour catch was 1.40 inches at Canyon Dam on the 19th. The 0.84 inch at Sacramento during a 24-hour period on the 18th and 19th was the greatest 24-hour catch in September since 1918. In San Francisco the 0.33 inch during this same period made this the wettest September there since 1940. In southern California, below the 36th parallel, except for a few stations reporting less than 0.15 inch, no measurable rain fell all month.

The U. S. Geological Survey reported that deficient runoff in southern California decreased somewhat in relation to median, and runoff in the northern part of the State continued well above median.

According to the California Weekly Weather and Crop Bulletin the weather was favorable for crops and harvesting in the north and central coastal counties although some light damage was caused by mid-month rains to prunes, tomatoes, grapes, and strawberries in Santa Clara County. The Gravenstein apple harvest was completed, and agriculturalists were pleased with the good quality and quantity of the grape crop. Rains caused some rather heavy damage to the tomato and grape industry in the Sacramento Valley, but drying north winds that followed the rains brought the situation well back to normal. Rains did benefit range grasses as renewed growth was observed on grazing lands on the west side of the Valley. Grape picking in the Lodi area was ahead of schedule, and it was predicted that all-time highs would be reached for Clingstone peaches, Bartlett pears, and almonds. In the San Joaquin Valley little damage to crops was attributed to the rains although there may have been some extensive local damage to raisins in the extreme northern portion of Merced County. Just under an inch of rain at Sonora was favorable to pastures and to the apple crop. The raisin crop was at its peak, and cotton prospects were good as the continued ideal weather pushed the crop about 10 to 14 days ahead of its 1955 progress. This same warm weather was also conducive to increasing the insect population, and spotted aphis infestation was severe throughout alfalfa fields in Fresno, Madera, and Merced Counties. Hot weather in the Santa Barbara and Santa Maria areas caused a delay in oil spraying of lemons, and caused considerable sunburn damage to walnuts and tomatoes. Continued hot weather in the Los Angeles and San Diego areas was generally beneficial to most crops although it did contribute to softening of some mature Valencias, and to sunscald on grapefruit, tangerines, and tomatoes. In San Diego County setting of December lemons was light. Good rains will be needed for development of size and quality. Growing conditions were ideal in Imperial and Palo Verde areas and the land was being extensively prepared for future plantings of lettuce and carrots. Light winds during morning and evening hours favored crop-dusting operations.

Range and pasture feed conditions, as reported by the California Livestock and Range Report, were on a whole somewhat above average, as dry range forage was generally adequate except in the coastal area south of Los Angeles.

REFERENCE NOTES

Additional information regarding the climate of California may be obtained by writing to the State Climatologist at Weather Bureau Office 557 Federal Office Building, 450 Fulton Street San Francisco 2, California or to any Weather Bureau Office near you.

The four-digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2 and on the maps became effective with data for January 1941.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means from which departures are computed are based on 10 years or more of record ending generally with data for 1950.

Long-term means for full-time stations (those shown in the Station Index as 'U. S. Weather Bureau') are based on the period 1921 - 1950, adjusted to represent observations taken at the present location.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4.30 a.m., PST, except for Bishop WB AP which is 6 00 a.m., PST; Blue Canyon WB AP and Sandberg WB 6 00 a.m. PST.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

/ Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".

D Water equivalent of snowfall wholly or partly estimated, using ratio of 1 inch water equivalent to every 10 inches of new snowfall.

G In the "Refer to Tables" column in the Station Index the letter "G" indicates Daily Soil Temperatures are published.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in "Hourly Precipitation Data".)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 20 cents per copy, monthly and annual; 2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

OCTOBER 1956
Volume LX No. 10

ASHEVILLE: 1956

WEATHER SUMMARY

The outstanding weather feature for October was the passage of three major storms that resulted in local flooding, some crop damage due to hail and high winds, and the cooler than usual weather that prevailed generally over all the State. Frost was reported in southern California growing areas on the 24th - 25th, but no apparent damage was observed. The first storm of the month occurred during the first week as a low pressure area developed in upper levels off the coast and moved inland over the Santa Maria area on the 4th and to Los Angeles on the 5th. Southwesterly flow of air around this Low brought sufficient moisture to cause scattered light to occasionally heavy shower and thunderstorm activity over much of central and southern California. Thunderstorms in the Santa Maria area on both the 3d and 6th were the first observed in the last 14 years. Heaviest damage occurred in the Taft-Bakersfield area where 1.15 inches of rain accompanied by hail fell within a three-hour period. A second storm on the 23d - 24th was responsible for closing State Highway 4 at Ebbetts Pass and Tioga Pass, and the strong winds following it caused considerable damage in southern California. The third storm of the 29th to 31st dumped a considerable amount of precipitation in the northern half of California and caused high winds throughout the major valleys of the State damaging trees, orchards, and power lines. Further details of these storms will be found at the end of this summary.

Temperature anomalies were generally negative over all the State dropping to as much as -6.0° at Tulelake 2 SE in the northern half and to -5.0° at San Antonio Canyon Mouth in the southern half. North of the Tehachapis daily temperatures, as shown by Weather Bureau Airport Stations, were as much as 18° to 19° below normal from the 8th to 14th and again during the last 10 days of the month. Coldest monthly temperatures were very much in evidence during this last period with Boca and Donner Memorial State Park recording a minimum of 4° on the 24th, and Squaw Valley Lodge had a 4°-minimum on the 29th. Warm spells were noted during the first week of October when temperatures were up to 12° above normal and occurred again from the 15th to 20th when they were up to 8° above. South of the Tehachapis temperatures were near or occasionally up to 8° above normal over most of the month, but fell to 9° below during the last five days. Temperatures during this cool period were sufficiently low to offset the earlier warm days so that they averaged below the October expectancy. White Mountain 1, elevation 10,150 feet, was the coldest spot in the State where -7° was recorded on the 29th. This was the coolest October since 1945 at Bishop, the coolest since October 1946 at Mt. Shasta, and tied the coolest on record at Blue Canyon. Brawley had the highest temperature for the month, 108° on the 1st. Monthly mean temperatures ranged from a high of 77.0° at Brawley to a low of 26.5° at White Mountain 2.

Precipitation in northern and central California was considerably above the October expectancy at the majority of stations; however, in the southern part of the State, with a few exceptions, precipitation was below the usual expectancy. The heaviest rains for the month with totals exceeding 10 inches fell for the most part in an area in the northwestern corner of the State bordered by Orick Prairie Creek Park to the south, Somesbar 1 W to the east, and thence northward to the Oregon border; in the Cummings area; and at a few stations in the Sierras west of Lake Tahoe. Gasquet Ranger Station was the wettest spot with a monthly total of 17.71 inches, 9.11 inches above its October average. The wettest day appeared to be the 30th when catches exceeding two and a half inches were quite common. Bullards Bar Power House measured the greatest daily catch, 4.92 inches on this day. In contrast, however, the greatest monthly total in southern California was the 1.41 inches that fell at Hoegees. Of this total, 1.09 inches fell on the 5th, the "wettest" day generally in that part of the State. In all, 20 stations received no precipitation all month, all south of the Tehachapis and mostly in the South East Desert Basins.

Snowfall in the mountains, usually above the 5,000-foot level, was unusually heavy for October as Mt. Shasta received its heaviest fall since snowfall records began in 1895, and during the 24-hour period 29th - 30th Blue Canyon reported its greatest catch on record for October, 7.4 inches. By month's end Twin Lakes measured 15 inches of snow on the ground, and Soda Springs had 26 inches on the ground, 18 inches of which fell on the 31st.

According to the California Weekly Weather and Crop Bulletin the weather during the month was favorable for crops and harvesting activities in the north and central coastal counties; however freezing temperatures on the 24th nipped some tomatoes and grapes, and showers caused some apprehension about mildew in grapes. The apple harvest was of excellent quality in Santa Cruz County, but the heavy prune crop in Sonoma County was of poor quality and of small size. Rain in Sacramento Valley occasionally interrupted harvesting activities; however, intermittent warming periods resulted generally in favorable drying conditions. Alfalfa cutting was considerably behind average because of the rains. The fifth cutting completed in Yolo County compared to the average middle of October date for the sixth cutting. Winds and rain caused walnuts to loosen on trees, and speeded the harvesting which was one of the latest in recent years due to favorable weather continuing so long in the season. The raisin crop in the San Joaquin Valley was damaged, to a small extent, by excessive early morning dew and also by the rain, but fortunately most of the raisins had already been boxed. Cotton picking was underway and the light frost of the 25th helped defoliate some of the cotton in the colder areas. The heavy rains in the Bakersfield area on the 6th and 7th downgraded some of the cotton, and in some areas hail beat cotton bolls to the ground where they were splashed with dirt. The first rains of the season in the Los Angeles area were too light to be of much benefit except to the shallow rooted crops and to temporarily reducing the fire hazard in the mountains. Warm and humid weather was favorable to the citrus and vegetable crops, and cold nights toward month's end helped color Navel oranges. In the San Diego area much more rain was needed to replenish soil moisture, the lack of which has affected most crops during the past years. The heavy showers of the 28th apparently fell only near San Diego as outlying areas remained relatively dry. Except for some damage caused by high winds during the last week in Imperial County, the monthly weather was generally favorable for all crops.

Weather Records Processing Center
U. S. Weather Bureau
San Francisco, California

SEVERE STORMS OCTOBER 1956

Lightning accompanying the storm of the 4th and 5th caused power outages about 11:30 p.m. on the 4th in the Paso Robles area, and flash floods inundated a number of fields and several streets in the eastern section of Paso Robles. The most intense thunderstorms occurred in the Taft-Bakersfield area on the 6th resulting in many power outages and considerable flood damage to roads, buildings, and agricultural crops. The 1.20 inches that fell at Bakersfield in 24 hours was the greatest daily catch since October 25, 1940. Hail three-eighths inch in diameter fell at the airport, and there were unofficial reports in East Bakersfield of hailstones up to two inches in diameter. Although some streets were flooded in Bakersfield the most damage to streets and homes occurred in Ford City, Dusty Acres, Valley Acres, Fellows, Derby Acres, Maricopa, South Taft, and Taft Heights for which areas the American Red Cross listed four minor injuries, minor damage to 221 homes and 71 other buildings, 29 of these small businesses. Damage to county roads was estimated at $250,000. Hail also occurred as far south as Palmdale where the observer reported hailstones up to one-half inch in diameter on the 6th. The heaviest hailstorm was reported near Susanville on the 7th when a severe thunderstorm developed in the vicinity of Shaeffer Mountain and moved rapidly west-southwest depositing as much as three inches of hail in some areas, with the size of the stones ranging up to three-quarters inch in diameter and causing some damage to electrical installations and county roads in that area.

The storm of the 23d to 24th caused moderate to heavy precipitation in the north coastal counties and the Sierra with snowfall in the Sierra closing Ebbetts Pass and Tioga Pass Roads. High gusty winds the evening of the 23d caused damage to power lines and television antennas in the Los Angeles area from Santa Monica to Palos Verdes Hills, in southeastern interior areas, and Kern County. A number of house trailers were blown off the road east of Tehachapi Pass, and nearly 100 miles of U. S. Highway 99 between Banning and Westmoreland in the Imperial Valley were closed by blowing sand and dust. Santa Ana winds through Cajon Pass on the 24th caused some damage in western Riverside County and blew down a number of rubber and carob trees in the Culver and Studio Village areas. North winds at Fontana Kaiser reached a fastest mile of 58 m.p.h. on the 24th. Temperatures dropped to much below normal behind the storm front with an unusually early first frost of the season reported in the Los Angeles area on the 24th.

A storm front from the north Pacific moved southeastward across northern and central California on the 29th and 30th

WEATHER SUMMARY (Continued)

causing heavy precipitation and heavy snow in the Sierra. Strong winds in the upper Sacramento Valley on the 29th and 30th caused considerable damage to power lines and in orchards, breaking limbs of prune, walnut, and olive trees, and knocking off or damaging many unharvested olives in some orchards. Winds reached fastest miles of 45 m.p.h. at Red Bluff on the 29th and 50 m.p.h. on the 30th. The front moved on south to southern California on the 31st, and in the Los Angeles area many trees were blown down, and utility lines damaged with the Manhattan Beach and southwest Los Angeles areas hardest hit.

Robert F. Dale,
State Climatologist
U. S. Weather Bureau
San Francisco, California

REFERENCE NOTES

Additional information regarding the climate of California may be obtained by writing to the Weather Bureau State Climatologist, 557 Federal Office Building 50 Fulton Street, San Francisco 2, California, or to any Weather Bureau Office near you.

The four-digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue

Divisions, as used in Table 2 and on the maps became effective with data for January 1941.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles Degree days are based on a daily average of 65° F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means from which departures are computed are based on 10 years or more of record ending generally with data for 1950.

Long-term means for full-time stations (those shown in the Station Index as 'U. S. Weather Bureau') are based on the period 1921 - 1950, adjusted to represent observations taken at the present location.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 6 00 a.m., PST; Blue Canyon WB AP and Sandberg WB 6 00 a.m. PST.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry Consult the annual issue of this publication for interpolated monthly totals

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

\# Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations These stations are processed for special purposes and are published later in "Hourly Precipitation Data".

D Water equivalent of snowfall wholly or partly estimated, using ratio of 1 inch water equivalent to every 10 inches of new snowfall.

G In the "Refer to Tables" column in the Station Index the letter "G" indicates Daily Soil Temperatures are published.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in "Hourly Precipitation Data".)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price. 20 cents per copy, monthly and annual; 2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NOVEMBER 1956
Volume LX No. 11

ASHEVILLE: 1957

WEATHER SUMMARY

The presence of a nearly stationary high pressure area over the western United States throughout most of November resulted in unusually dry weather, relatively warm daytime temperatures, and was responsible for numerous and severe Santa Ana winds in southern California. A major fire, fanned by the winds, began in the Cleveland National Forest north of Descanso on the 19th, and by the time it was brought under control on the 30th, 44,000 acres of brush and timber land were destroyed in the San Diego River watershed with a perimeter of 90 miles. The fire caused 11 deaths, many injuries, destroyed 9 homes, 2 wooden bridges, and caused the evacuation of the Trojan Powder Company plant. Another major fire broke out just after mid-month in the San Bernardino Mountains burning over 15,000 acres of forest land before being brought under control. No injuries or deaths were attributed to this fire. A more detailed description of the many windstorms in the State during November will be found at the end of this summary. In the northern half of the State overall mean temperatures were generally close to the November average; however, this was due mainly to the fact that the unusually clear days produced higher than average daytime temperatures that balanced lower than usual nighttime temperatures. The southern half of the State experienced generally above average temperatures especially in the coastal and interior valleys. Except along the northern coastal sections where considerable fog and low clouds prevailed, the percent of possible sunshine was very high over the remainder of California. Those stations having sunshine recorders showed the following: Fresno received 97 percent of possible sunshine compared to a November average of 73 percent; Los Angeles received 96 percent compared to 79 percent; Sacramento 94 compared to 63; Red Bluff 93 compared to 60; San Diego 90 compared to 76; and San Francisco 89 compared to 62.

North of the Tehachapis temperature anomalies were variable, ranging from -5.4° at Deer Creek Power House to +6.6° at Jess Valley. South of the Tehachapis the anomalies were mostly on the plus side except in scattered spots along the coast and in the desert regions, ranging from -2.9° at El Centro to +9.6° at Escondido Church Ranch. Daily temperatures, as shown by Weather Bureau First-Order Stations, were as high as 20° above normal during the period 6th to 11th over the State, and in southern California rose to as high as 14° above again from the 22d to 30th. The highest temperature in the State was 100° reported at four stations in the South Coast Drainage either on the 9th or 10th. Coolest weather for the month occurred on the 1st and 2d and again on the 19th and 20th when temperatures were as much as 20° below daily averages. White Mountain 2 recorded the lowest minimum, -9°, on the 20th. Some November temperature records were broken mainly from Santa Maria southward. The 95° on the 8th and 9th at Los Angeles Airport was the warmest on record; at San Diego the 96° on the 9th was the warmest ever for November, and the monthly average maximum temperature of 76.5° was the highest since records began in 1874; the highest of record at Santa Maria, 93°, was observed also on the 9th. Monthly mean temperatures ranged from a high of 68.6° at Sierra Madre 1 N to a low of 26.1° at White Mountain 2.

Precipitation was very light over the State making this one of the driest Novembers of record. South of the 37° parallel nearly every reporting station had no precipitation at all, and only a few stations in the extreme northwest corner of California reported precipitation of any consequence ranging from 1.09 inches at Somesbar 1 N to the greatest monthly total 3.25 inches at Gasquet Ranger Station. The great majority of stations received less than 25 percent of the usual November expectancy, with most of the precipitation occurring either on the 1st and 2d or at a few places on the 16th and 17th. The greatest daily catch was 1.57 inches at Smith River 3 WNW on the 1st. Some examples of the lack of rain: This was the first November since 1936 with no rain at Bakersfield; this was the driest of record at Blue Canyon; this was the driest since 1933 at Eureka and the fourth driest of record; this was the fourth of record with no rain at Fresno; this was the sixth driest since records began in 1888 at Mt. Shasta; there have been only eight other years with less rain at Sacramento in 108 years of record; this was the sixth driest November since records began in 1849 at San Francisco; and this was the first November since 1904 with no rain at San Diego. Snowfall was very light in the mountain areas, and all stations that had snow on the ground at the end of October had none by the end of November. Of the nearly 600 stations sending in reports for November, 326 of them, or 55 percent, were rainless.

According to the California Weekly Weather and Crop Bulletin rains during the beginning of the month in northern and central coastal counties were beneficial to cover crops and grasses on ranges and pastures, but the generally dry weather, frosty nights, and dry winds turned many pasture lands brown, and growers without overhead irrigation in Santa Cruz County were forced to delay strawberry planting until more substantial rains came. Harvesting of grains such as rice, corn, and milo in the Sacramento Valley were delayed during the early rains; however the dry weather following was favorable for cotton harvesting and alfalfa seed harvesting. Firing was necessary in citrus orchards in the San Joaquin Valley near the 20th when temperatures dropped to near freezing. Cold mornings generally hastened dormancy of fruit trees and temporarily reduced the sugar content of oranges in the Delano area. Ranges became very dry in the Santa Maria area and heavy irrigation was being given to tree crops. Frost damaged tomatoes and peppers during mid-month around San Luis Obispo. In the Los Angeles area hot days and cool nights with very low humidity and considerable windiness continued to dry vegetation, increase irrigation demands, and cause a high fire hazard. Desert winds blew some fruit and foliage from citrus trees, and produced some scarring of the fruit. Strong and gusty easterly winds also caused considerable damage to the avocado and citrus crops in San Diego County. Tomatoes were still showing the effects of the previous high temperatures, and the need for moisture continued to be serious for all crop growth. In Imperial and Coachella Valleys low nighttime temperatures slowed vegetative growth and damaged tomatoes and eggplant. However, generally clear weather was favorable to crops and harvesting activities. Only slight damage to crops was attributed to wind in these valleys.

WINDSTORMS OF NOVEMBER 1956

According to a report from the State Climatologist's Office in San Francisco the following windstorms were noted:

On the 1st, 2d, and 3d -- Strong winds in the East San Francisco Bay region caused heavy damage to trees and powerlines. A billboard was blown down and a plate glass window was shattered in a market in Oakland. Santa Ana wind conditions were experienced in southern California causing light damage.

On the 13th and 14th -- Heavy duststorms occurred in the Mojave Desert. Widespread, but minor damage was reported in San Bernardino County. Wind damaged a drive-in theatre screen, falling tree branches broke some powerlines, and a few television antennas were toppled. Numerous brush and grass fires were observed.

On the 18th to 29th -- A strong northeast-southwest gradient in association with the persistent high pressure area over the western United States caused strong northerly winds in northern and central California with gusts 40-50 m.p.h. on the 18th and 19th. In Chemaketa Park Santa Clara County, a large redwood tree was toppled crashing through the roof of a house. Severe and unusually persistent Santa Ana wind conditions in the Mojave Desert and southern California coastal areas began on the 19th and continued sporadically until the 29th. Wind gusts reached 90 m.p.h. at Fontana Kaiser on the 20th, and gusts to 100 m.p.h. were reported from the Sierra Pelona forest lookout station northeast of Saugus. Widespread damage was reported, including damaged roofs, television antennas, broken windows, broken power and telephone poles, and many sand and gravel-pitted automobile windshields. A Navy landing craft went aground on San Clemente Island. Heavy damage to oranges and lemons was reported in citrus areas in the southern California coastal counties. Cleanup of dust and debris taxed sanitation and street cleaning facilities.

Additional Notes

Additional information regarding the climate of California may be obtained by writing to the Weather Bureau State Office at Room 1 - 7 Federal Office Building, 50 Fulton Street San Francisco 2, California. Ask for Publication No. 1, Area Weather Bureau Office near you.

The four-digit identification numbers in the Index Number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index but for which data are not listed in the tables are either missing or received too late to be included in this issue.

Division, as used in Table 2 and on the maps became effective with data for January 1941.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F, precipitation and evaporation in inches and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured on the standard Weather Bureau type pan of 4 foot diameter, unless otherwise shown by footnote following Table 6.

Long-term means from which departures are computed are based on 10 years or more of record ending generally with data for 1950.

Long-term means for full-time stations (those shown in the Station Index as U.S. Weather Bureau) are based on the period 1921 - 1950, adjusted to represent observations taken at the present location.

Amounts in Table 4 are from non-recording gage, unless otherwise indicated.

Water equivalent samples, as published in Table 2, are necessarily taken from different points for successive observations, consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground.

Data in Tables 1, 2, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 1 30 a.m., PST, except for Bishop WB AP which is 8 00 a.m., PST, Blue Canyon WB AP and Sandberg WB 1 00 a.m. PST.

--- No record in Tables 1 to 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.

+ And also on a later date or dates.

* Amounts included in following measurement; time distribution unknown.

Thermometers are generally exposed in a shelter located a few feet above snow-covered ground, however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates re-order stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".

D Water equivalent of snowfall wholly or partly estimated, using ratio of 1 inch water equivalent to every 10 inches of new snowfall.

G In the "Refer to Tables" column in the Station Index the letter "G" indicates Daily Soil Temperatures are published.

M One or more days of record missing, see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in "Hourly Precipitation Data".)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

DECEMBER 1956
Volume LX No. 12

ASHEVILLE: 1957

WEATHER SUMMARY

For the second month in succession most of California remained relatively dry as a persistent ridge of high pressure over the eastern Pacific and the coastal states deflected most storms farther north. With the exception of a small area in the northwest section where some monthly precipitation totals exceeded 12 inches, reports from stations indicated this to be one of the two driest Decembers of record. Only one major storm passed over the State. This storm, on the 4th to 7th, broke a dry spell that had prevailed since October; however, benefits from it were short-lived as a flow of dry air from the northeast, especially during the last ten days of December, dried out rangelands and was responsible for an extremely high fire hazard toward month's end. Strong Santa Ana winds over southern California made control of a brush fire that broke out on the 24th in the Malibu area, Los Angeles County, impossible until the 28th. One life was lost in the holocaust, 40,000 acres of valuable watershed burned, and 67 homes were destroyed. Damage from the fire was estimated to be many millions of dollars. A description of the December windstorms will be found at the end of this summary. A cold fog covered much of the San Joaquin Valley and also parts of the Sacramento Valley from the 15th to 21st. As a result monthly mean temperatures in these areas were lower than in the surrounding foothills which were generally above the fog. The percent of possible sunshine continued the trend begun in November being considerably higher than average, especially along the coast from San Francisco southward and in interior valleys. Stations having sunshine recorders reported: Sacramento, 72 percent of possible sunshine compared to a December average of 42 percent; Fresno, 73 percent compared to 47 percent; Red Bluff, 85 compared to 48; San Francisco, 85 compared to 54; Los Angeles, 88 compared to 72; and San Diego, 88 compared to 70.

Temperature anomalies were generally quite variable in all divisions although they were predominantly negative in the North Coast Drainage and mostly positive in the South Coast Drainage. The extremes of anomaly ranged from -5.5° at Deer Creek Power House to +9.8° at Fontana Kaiser. The very clear weather that prevailed over much of California resulted not only in unusually warm daytime temperatures but also in unusually cold nighttime temperatures. At Santa Maria, for example, the average maximum temperature was the highest on record and the average minimum temperature came within one degree of tying the lowest on record, both for December. This was also the warmest December of record at Blue Canyon and Red Bluff. The month started out warm with mean temperatures up to 17° above daily normals, as shown by Weather Bureau Airport stations, and, with the exception of the period during mid-month when fog covered many of the valleys, it was generally warm from the 11th through the 31st, being warmest during the last five days of the month when daily temperatures rose up to 23° above normal. Fontana Kaiser recorded the highest temperature, 91°, on the 30th. The period from the 5th to 9th, during and just following a major storm front, was cool with daily temperatures dropping to as much as 19° below average. In much of the San Joaquin Valley and parts of the lower Sacramento Valley during the foggy period 16th to 25th, temperatures dropped to 15° below average, and on the 21st the maximum temperature of 36° at Bakersfield equaled the all-time low maximum for any date there. The -24° recorded at Boca on the 8th was the lowest in the State. Mean monthly temperatures ranged from a high of 62.8° at Sierra Madre 1 N to a low of 22.0° at White Mountain 2.

Only a few stations measured near average precipitation, mostly near and along the northwestern coast, the maximum being 16.06 inches at Smith River 3 WNW, whereas the rest of the State received far less than the December expectancy. The greatest daily catches were 4.11 inches at Klamath on the 11th and 4.10 inches at Orick Crick Prairie Park on the same day. In southern California only a few stations in the mountains reported monthly totals exceeding an inch, the maximum being 1.33 inches at Lake Arrowhead -- 1.01 inches of this total measured on the 6th. In general, the only other section reporting totals of any consequence was in the Sierras west of the Lake Tahoe area where up to 4.17 inches were measured. The condition of rangelands and non-irrigated crops over most of the State was becoming serious because of the inadequate precipitation this past month which is usually one of the wetter winter months. This was the driest December at Mt. Shasta since records began in 1888 as only seven percent of normal precipitation fell. It was also the driest of record at Red Bluff and Blue Canyon. Sacramento received its least December rainfall since 1876, and it was the third driest at San Francisco in 108 years of record.

The snowpack in the mountains was fairly well depleted by month's end. Only areas above the 10,000-foot mark in central and northern California appeared to have any appreciable snow remaining on the ground. Some representative snow stations below 10,000 feet showed the following: Boca had a maximum depth of 18 inches on the ground on the 6th that dwindled to a trace by the 31st; Twin Lakes dropped from 31 inches on the 6th to 7 inches on the 31st; Sagehen Creek dropped from 27 inches on the 5th to 8 inches on the 31st; and Soda Springs dropped from 32 inches on the 7th to a trace on the 31st.

According to the California Weekly Weather and Crop Bulletin, the light to moderate rains during the early part of December benefited ranges, pastures, and crops over the State, but the long dry spell following these rains plus the high incidence of frost especially in the valleys of central and northern California were very unfavorable to agriculture in general. Winter irrigation was in full swing in many sections both to aid crops already planted and to moisten the ground sufficiently for digging and planting. Many farmers were faced with the dilemma as to whether or not to irrigate since should heavy rain follow extensive irrigation, the soil would become so saturated it would delay grain planting even more than the dry weather. The dry weather was favorable for harvesting activities, and a good yield in the cotton crop was experienced in many counties. Livestock producers continued the heavy supplemental feeding program as old range feeds were pretty well exhausted during the month. Excepting in a few areas, the new feed would not be adequate for much grazing for several weeks. Stock was still in generally good condition.

WINDSTORMS DECEMBER 1956

According to a report from the State Climatologist's Office in San Francisco, widespread but minor damage occurred in southern California coastal and desert counties on the 8th and 9th, 22d, and 24th to 28th when high pressure over the western plateau caused Santa Ana wind conditions. Trees, powerlines, and holiday decorations were blown down; highway traffic was disrupted by blowing dust; dwelling roofs were damaged; citrus fruit and foliage were blown off trees and the quality of the fruit was lowered due to scarring; numerous brush fires were fanned by the wind; and in some instances automobile windshields were pitted by blowing gravel. During the winds of the 8th to 9th one person was injured by flying glass from a blown-out store window and two persons were injured in an automobile accident caused by restricted vision from blowing dust. It was during the windstorms of the 24th - 28th that the costly and destructive fire in the Malibu area occurred. Winds 200 feet above the ground at Fontana Kaiser reached 80 m.p.h. on the 8th and 85 m.p.h. on the 22d.

See reference notes following Station Index.

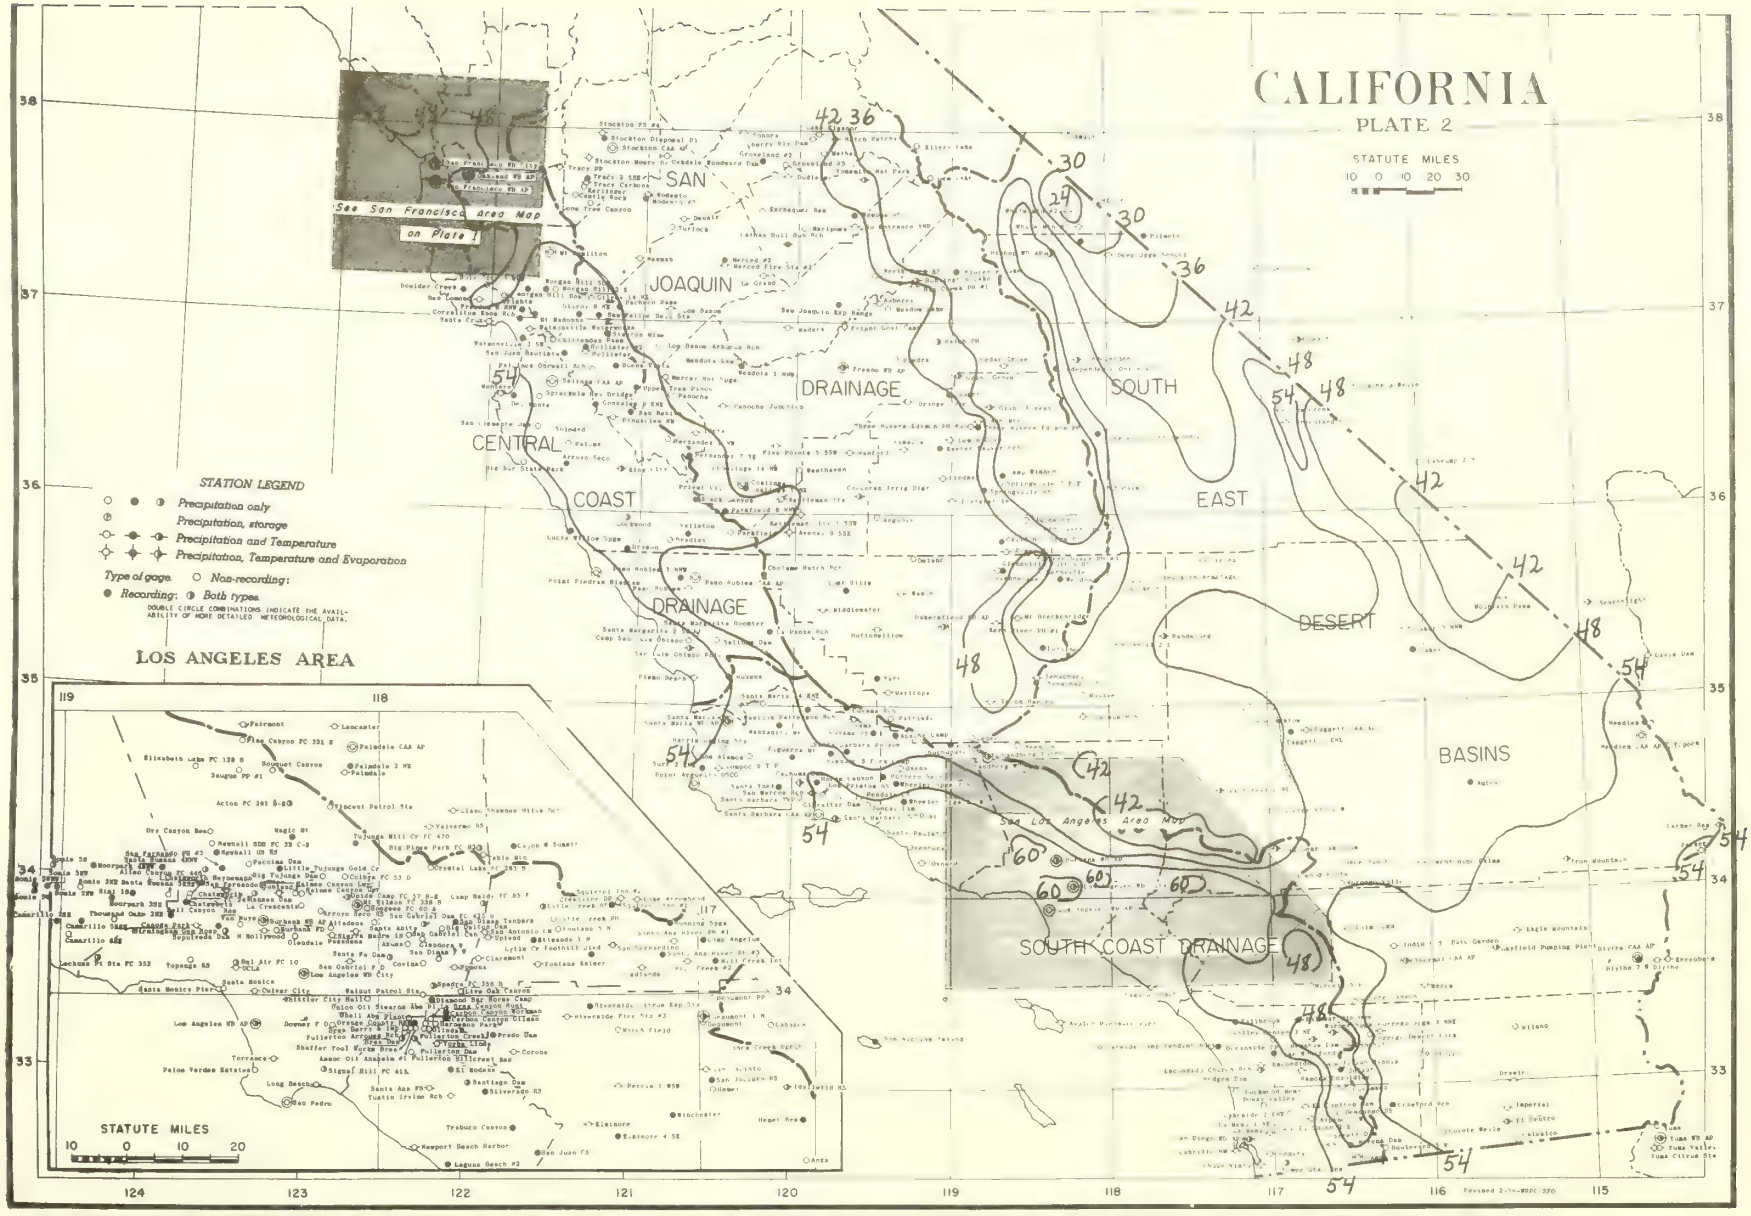
FEBRUARY 1929	STOCKTON 1	CLIMATOLOGICAL DATA AND DAILY TEMPERATURE TABLES: Max temperature, 12th, should be 58, mean max, 60.9, and mean monthly, 47.2.
JUNE 1945	ALDERPOINT	CLIMATOLOGICAL DATA TABLE: Monthly mean temperature should be 65.8. Lowest temperature 24 should be deleted.
JUNE 1954	STOCKTON FIRE STATION 4	TABLES 2 and 3: Precipitation on 13th should be .03, monthly total .18, departure +.08, greatest day .06 on 6th, and days with .10 or more zero.
JUNE 1955		SUPPLEMENTAL PRECIPITATION DATA, DELAYED DATA: Add Santa Barbara County Flood Control and Water Conservation District to list of, "Data were collected with the cooperation of the individual observers...."
DECEMBER 1955		SUPPLEMENTAL PRECIPITATION DATA: Heading for table should be Storm of December 16 through 27, 1955.
MARCH 1956	PISMO BEACH	TABLE 5: Min temperature on 28th should be 52.
JULY 1956	MOUNT HEBRON RS	TABLES 2 and 3: Precipitation on 11th should be .09; 26th, .07; 27th, .10; monthly total .30; greatest day .10 on 27th; and days with .10 or more 1.
AUGUST 1956	IRON MTN LOOKOUT	PRECIPITATION MEASURED IN STORAGE GAGES TABLE, Page 232: Observation date July 30, 1956 should be July 15, 1956. Precipitation measured on July 15, 1956 should be 73.30.
	MOUNT SHASTA SLOPE	PRECIPITATION MEASURED IN STORAGE GAGES TABLE, Page 232: Precipitation measured on July 25, 1956 should be 87.00.
	ROBERTSON FLAT	PRECIPITATION MEASURED IN STORAGE GAGES TABLE, Page 232: Precipitation measured on July 11, 1956 should be 104.40.
	STOUTS MEADOW	PRECIPITATION MEASURED IN STORAGE GAGES TABLE, Page 232: Precipitation measured on July 25, 1956 should be 121.15.
	TALBOT CAMP	PRECIPITATION MEASURED IN STORAGE GAGES TABLE, Page 232: Precipitation measured on July 12, 1956 should be 94.85.
	WRIGHTS LAKE	PRECIPITATION MEASURED IN STORAGE GAGES TABLE, Page 232: Precipitation measured on July 14, 1956 should be 79.40.
SEPTEMBER 1956	CHICO EXP STA	TABLE 6: Evaporation on 30th should be .56 and monthly total 6.99.
	CRESCENT CITY 7 ENE	TABLE 3: Precipitation on 10th should be .54 and precipitation on 11th .00.
	JOICE ISLAND	TABLE 6: Wind movement on 30th should be 108 and monthly total 2338.
	SCOTIA	TABLES 2 and 5: Temperature record 25th through 29th should be on 26th through 30th. Add max and min temperatures on 25th, 71 and 47, respectively. Mean max should be 71.8, mean min 49.7, mean 60.8, departure -0.3, and total degree days 131.
OCTOBER 1956	CACHUMA DAM	TABLE 6: Evaporation on 4th should be .10 and monthly total 4.82.
	PASADENA	TABLES 2 and 5: Max temperatures on dates indicated should be as follows: 4th, 76; 11th, 73; 18th, 70; 22d, 82; 23d, 71; 27th, 71; 28th, 63. Mean max should be 76.6, mean 64.6, departure -0.3, and total degree days 60.
	SIERRAVILLE RS	TABLES 2, 3, and 7: All precipitation on snowfall record for period 24th through 31st should be set back one day. Precipitation on 31st should be 1.13, snowfall 3.0, and snow on ground 3. Monthly precipitation total should be 5.20, departure 3.82, greatest day 1.13 on 31st, total snowfall 7.0, greatest snow on ground 3 on 31st, and days with .10 or more 8, .50 or more 3, and 1.00 or more 3.
	UNIV OF CALIF AT L A	TABLES 2 and 5: Min temperature on 30th should be 48, mean min 55.8, mean 63.5, departure -2.2, date of lowest 29 and other days, and total degree days 75.
NOVEMBER 1956	PASADENA	TABLES 2 and 5: Max temperature on 13th should be 75 and 19th 74. Mean max should be 81.0, mean 64.2, departure 4.6, and total degree days 75.

TOTAL PRECIPITATION

DECEMBER 1956



ISOLINES ARE DRAWN THROUGH POINTS OF APPROXIMATELY EQUAL VALUE. CAUTION SHOULD BE USED IN INTERPOLATING ON THESE MAPS, PARTICULARLY IN MOUNTAINOUS AREAS.

REFERENCE NOTES

Additional information regarding the climate of California may be obtained by writing to the Weather Bureau State Climatologist, 557 Federal Office Building, 50 Fulton Street, San Francisco 2, California, or to any Weather Bureau Office near you.

The four-digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2 and on the maps became effective with data for January 1941

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means from which departures are computed are based on 10 years or more of record ending generally with data for 1950.

Long-term means for full-time stations (those shown in the Station Index as 'U. S. Weather Bureau') are based on the period 1921 - 1950, adjusted to represent observations taken at the present location.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4 30 a.m., PST, except for Bishop WB AP which is 6 00 a.m., PST; Blue Canyon WB AP and Sandberg WB 6 00 a.m., PST.

- No record in Tables 3, 5, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

\# Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".

D Water equivalent of snowfall wholly or partly estimated, using ratio of 1 inch water equivalent to every 10 inches of new snowfall.

G In the "Refer to Tables" column in the Station Index the letter "G" indicates Daily Soil Temperatures are published.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in "Hourly Precipitation Data".)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price 20 cents per copy, monthly and annual; 2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

CALIFORNIA

ANNUAL SUMMARY 1956

Volume LX No. 13

ASHEVILLE: 1957

WEATHER SUMMARY

GENERAL: The weather of the year 1956 marked an extreme transition from one of the wettest December, January, and February periods of record in north and central California with flooded conditions slowing the clean-up of flood damages and delaying farm work, to one of the driest Novembers and Decembers in the State, the increasing drought severity being reflected in almost all growing crops and grass on ranges and pastures. Unusually persistent and severe Santa Ana wind conditions in southern California aggravated the drought and increased the fire danger in southern California forests and chaparral to extreme, with major fires in November and December. Although the details of the year's weather have already been described in the respective monthly Climatological Data, to which the reader is referred for further information, some of the highlights of the year are summarized in the following paragraphs.

TEMPERATURES: The warm December 1955 weather continued through January 1956, but the warm spell ended with a cold February over the entire State. The -29° minimum at Boca on February 2 was the lowest temperature recorded in California during the year, and the February mean temperature of 8.8° at White Mountain 2 was the lowest monthly mean recorded during the year. With the exception of generally statewide below normal temperatures in August and October, and the above normal temperatures experienced in the south coastal sections under the Santa Ana conditions of November and December, there were no outstanding departures from monthly normal temperatures. Temperatures for the year averaged slightly below normal in north and central California and slightly above normal in southern California, divided approximately by the Tehachapi Mountains. There were the usual more extreme variations within months, however. An unusual warm spell occurring from July 16 to 26 accelerated the melting of ice and snow in the high Sierras causing heavy runoff on the eastern slope. The July mean temperature of 99.6° at Cow Creek was the highest monthly mean for the year. The annual high of 125° occurred on June 28 also at Cow Creek.

PRECIPITATION: After the heavy December, January, and February rains in northern California, the very dry, sunny March was welcomed by most agriculturists in drying the muddy fields and allowing rapid clean-up of the winter flood damages. In southern California and the upper San Joaquin Valley, however, due to dessicating winds and deficient rainfall in February and March, rain was needed by March. With the exception of above normal rainfall in southern and central California in April, the Central Valley in May, and northern and central California in October, the precipitation deficiency increased through the year. The drought became critical as the year ended with one of the driest Novembers and Decembers of record.

Annual total precipitation ranged from less than 10 percent of normal in the extreme southeastern desert area, including the Imperial and Coachella Valleys, to about 120 percent of normal along the middle California-Oregon border. Only the mountainous areas north of Mount Shasta with fingers extending southward along the coastal range and the Sierra to Dos Rios and Twin Lakes, respectively, received above normal annual precipitation. Foothill areas of the Sierra received about 80 to 90 percent of normal with most Central Valley stations receiving from 60 to 80 percent. Much of the Central Coastal Drainage and San Diego County received less than 60 percent of normal, the San Diego area receiving only about 40 percent of its normal annual precipitation. The immediate Los Angeles area received near 90 percent of its annual normal with about 2/3 of this total falling in January and about 45 percent in 24 hours on the 25th - 26th, the third greatest 24-hour precipitation on record for Los Angeles.

The greatest observational day precipitation reported during the year was 10.15 inches at Fontana 5 N on January 26. The greatest monthly total was 32.75 inches for January at Pit River Power House No. 5, and the greatest annual total was 102.21 inches at Gasquet Ranger Station. Gasquet Ranger Station also received the greatest seasonal total (1955 - 1956) with 125.89 inches. The least annual precipitation was zero at Ocotillo, and Brawley and Niland received less than 0.10 inch. The least seasonal precipitation (1955 - 1956) was 0.41 inch at Greenland Ranch.

DESTRUCTIVE STORMS: The heavy January rains on the still saturated soils and flooded lowlands from the December rains in northern and central California caused recurrent flooding and mudslides in north coastal drainages and washed out the uncompleted repairs of the Feather River levee at Nicolaus, reflooding that city. Water still remained in much of the Reclamation District 1001 from the December floods, however, with some houses in that district being under water approximately six weeks. On January 25 and 26 the first heavy rains in the Los Angeles area caused local flooding and one death, the greatest single property loss occurring to the Ford Motor Company Plant in Long Beach. Wind damage and recurrent flooding also occurred with this storm in central and north coastal portions of the State, streams in the upper Salinas Basin reaching their highest stages of record on the 25th. Flooding occurred in low-lying areas of the San Francisco Bay area and in about one-third of Visalia. High winds and heavy rains on February 19 to 23 again caused flooding and mudslides in northern California south to the San Francisco Bay area. The Russian River reached a crest more than 10 feet above flood stage at Guerneville on the 23d which, excepting the record December 1955 stage, was the highest since February 1940.

Santa Ana wind conditions prevailed over portions of southern California on March 6 and 12, and May 14 and 17 resulting in dust, sandstorms, and some wind damage. A man was killed in the March 12 storm when his automobile was blown from the road between Blythe and Indio. Small tornadoes, reported at Chula Vista on April 13 and at Alhambra on May 9, caused local damage to houses and trees. In the period July 17 to 29 an unusually high number of thunderstorms caused local flooding in southeastern desert and mountain areas, and lightning from these storms started about 600 forest fires. An intense thunderstorm in the Taft-Bakersfield area on October 6 caused flash floods and resulted in damage to many homes. Lightning caused many power outages; there were unofficial reports of hail stones to two inches in diameter in the East Bakersfield area; and rains caused considerable damage to cotton and alfalfa seed crops. High northerly winds in the upper Sacramento Valley caused considerable damage to powerlines and orchards on October 29 and 30.

Santa Ana wind conditions prevailed in southern California and Kern County on October 23 - 24 and again on the 31st. Unusually persistent and severe Santa Ana conditions became established over southern California through much of November and December with the greatest wind damage occurring on November 1 - 3, 13 - 14, 18 - 29, December 8 - 9, 22, and 24 - 28. These dessicating high northeasterly winds created extreme fire danger in the south coastal forests and chaparral. A major fire starting in the Cleveland National Forest north of Descanso on November 19 and fanned by wind gusts up to 100 m.p.h. burned 44,000 acres causing 11 deaths and many injuries before it was controlled on the 30th. A five-day fire began in the Malibu area of Los Angeles County on December 24, burning 40,000 acres of valuable watershed, 67 homes, and causing one death. The high winds also caused considerable damage to citrus fruit and foliage.

AGRILCULTURE: Despite the damage done to crops by the December, January, and February floods, the soggy soils and resulting delayed agricultural season in much of northern and central California, scattered rain, hail, heat, freeze, and wind damage occurrences described in the monthly Climatological Data, and damage to ranges and all crops from the drought prevailing at the end of the year, the 1956 agricultural season was generally regarded as favorable for California agriculture. Reports of the California Crop and Livestock Reporting Service show the 1956 production of California fruit and nut crops about 3 percent below that of 1955, but 1 percent above the 10-year average, and the combined value of these crops about 6 percent above that in 1955. Excerpts from the California Crop and Livestock Reporting Service reports are as follows: "Crops with above average production in 1956 were almonds, apples, cherries, dates, nectarines, olives, peaches, pears, plums, prunes, and walnuts. New high records for production were set for almonds, olives, clingstone peaches, and Bartlett pears. Those crops with below average production in 1956 were apricots, avocados, figs, grapes, grapefruit, lemons, and oranges. The record almond crop was the result of a good set, good soil moisture conditions, and a minimum of spring frost injury in main almond producing areas. Favorable weather conditions at blossom time for olives resulted in an extra heavy set in most orchards, and some olive growers who normally grow only canning fruit diverted their crops to oil on account of small sizes. While winter floods destroyed some acreage of clingstone peaches in Sutter County and caused damage to orchards in other areas the bearing acreage was still a little above 1955. This together with a slightly better set than in 1955 and sizes somewhat better than average resulted in the largest crop ever produced. Favorable spring weather for Bartlett pears with a minimum of frost damage resulted in good crops in practically all districts. Good size growth contributed to the development of the record crop. In most fruit growing areas the first frosts of the season came late in November of 1955 and there was sufficient cold weather following to provide a good dormant season for deciduous crops in most areas. While there were no long periods of extreme cold weather there was damage to citrus crops which resulted in lowered grades

(a) SANDY LOAM -- UNDER BARE GROUND SURFACE. (b) RAMONA SANDY LOAM -- BARE GROUND, EXPOSED TO THE SUN. (c) RAMONA SANDY LOAM -- UNDER THE EAST SKIRT OF A VALENCIA ORANGE TREE, SHADED AND UNDER REGULARLY IRRIGATED SOIL. IRRIGATION WATER PRESENT OCCASIONALLY, SEE NOTES IN MONTHLY CLIMATOLOGICAL DATA FOR DETAILS.
MONTHLY MAXIMUM AND MINIMUM AVERAGES FOR ALL STATIONS OBTAINED BY AVERAGE OF DAILY MAX AND MIN VALUES.
EXTREMES ARE THE HIGHEST MAXIMUM AND THE LOWEST MINIMUM FROM CONTINUOUS RECORDS.

See reference notes following Station Index.

Table 2

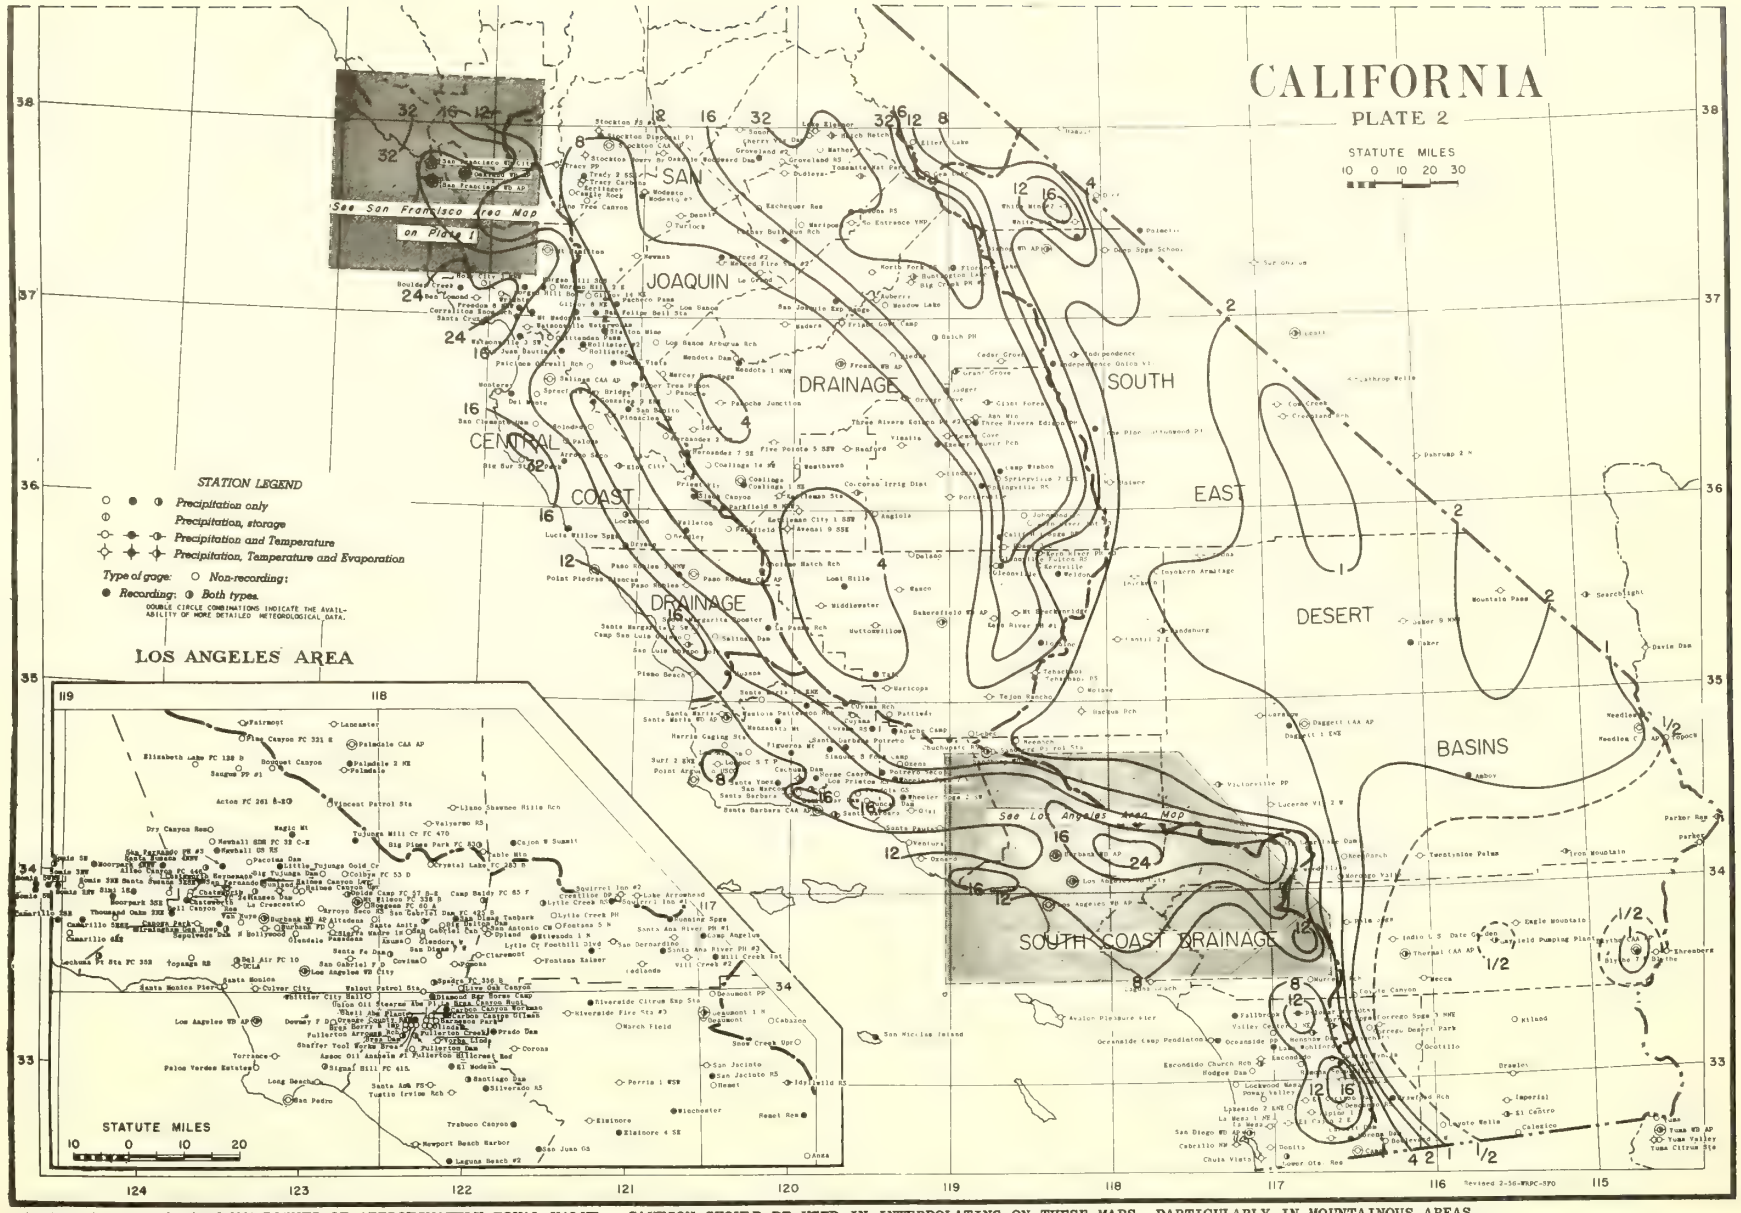
MAX AND MIN IN TABLE 4 REFER TO MEAN MAXIMUM AND MINIMUM TEMPERATURES OF WATER IN PAN.

WEATHER SUMMARY (Continued)

and diversion of some fruit to processing outlets. Fall rains in late September and early October resulted in damage to raisins on drying trays as well as to table grapes unharvested at that time. The aggregate value of field crops produced in California was $834,931,000 in 1956, 12 percent greater than the 1955 value and exceeded only in 1951 and 1952. Cotton accounted for one-third of the total value of field crops in 1956, followed by hay, potatoes, and barley. Cotton also outranked all other crops grown in the State followed by citrus, hay, grapes, and tomatoes. Except for flaxseed, hops, and alfalfa hay, yields per acre were above average for field crops with yields of corn, cotton, beans, and rice in the record high class. Curly top disease reduced yields of flaxseed and downy mildew hurt hops. Alfalfa hay yields, the lowest since 1949, were below average because of the spotted alfalfa aphid infestation." Total production of grain crops in California was 2,664,000 tons, 3 percent less than the 1955 record high. Acreage, production, and value of all vegetable and melon crops harvested reached an all-time high in California during the 1956 season. Tomatoes, both fresh and canning combined, ranked first in acreage, production, and value, followed by lettuce. The 1955 - 56 California orange crop totalled 38,770,000 boxes, about 8 percent below the 10-year average with prospects for a smaller 1956 - 57 crop. Movement of Navel oranges to the end of December was considerably more than for the same period last season. A decline in prospects for Valencia oranges was due mainly to slow growth of the fruit.

Details of each month's weather may be found in the monthly issues of this publication.



Robert F. Dale
State Climatologist
U. S. Weather Bureau
San Francisco, California

REFERENCE NOTES

Additional information regarding the climate of California may be obtained by writing to the State Climatologist at Weather Bureau Office, 557 Federal Office Building, 50 Fulton St., San Francisco 2, California, or to any Weather Bureau Office near you.

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in °F., precipitation and evaporation in inches, and wind movement in miles.

Evaporation is measured in standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 4.

The four-digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers with a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

- No record.

+ Also later date (dates) or months.

* Amount included in following measurement.

V Includes total for previous months. V in annual column means total is for a two-year period.

Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

B Adjusted to full month.

C Data for recorder stations denoted by "C" in the "Refer to Tables" column of the Station Index are processed for special purposes and published in "Hourly Precipitation Data". Length of record for recorder-only stations may be found in the annual issue of "Hourly Precipitation Data".

E Amount is wholly or partially estimated.

G In the "Refer to Tables" column of the Station Index the letter "G" indicates that soil temperatures are published.

M One or more days' record missing; if average value is entered, less than 10 days' record is missing. See monthly Climatological Data for detailed daily record.

R Amounts from recording gage. These amounts are essentially accurate but may vary slightly from the amounts to be published later in "Hourly Precipitation Data".

S Storage precipitation station. Data will be published in the July or August or delayed data December issue of Climatological Data.

T Trace, an amount too small to measure.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the annual summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to Superintendent of Documents, Government Printing Office, Washington 25, D. C.
